

BAKER BOTTS L.L.P.

30 ROCKEFELLER PLAZA

NEW YORK, NEW YORK 10112

TO ALL WHOM IT MAY CONCERN:

Be it known that WE, JEF DE BRABANDER and YUSHENG WU, citizens of Belgium and China, respectively, whose post office addresses are 1112 Grove Drive, Lewisville, Texas 75077 and 6017 Terrytown Terrace, Apt. # 5105, Dallas, Texas 75205, respectively, have invented an improvement in

SYNTHETIC SALICYLIHALAMIDES, APICULARENS AND DERIVATIVES THEREOF
of which the following is a

SPECIFICATION

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation application of pending U.S. Patent Application Serial Number 10/418,757 of De Brabander *et al.*, filed April 18, 2003, which is a continuation of U.S. Patent Application Serial Number 09/922,372 of De Brabander *et al.*, filed August 3, 2001, now issued as U.S. Patent No. 6,617,348, which claims benefit from provisional U.S. Patent Application Serial Number 60/222,809 of De Brabander *et al.*, filed August 4, 2000 and provisional U.S. Patent Application Serial Number 60/252,856 of De Brabander *et al.*, filed November 22, 2000, the contents of which are incorporated herein by reference in their entireties.

FIELD OF THE INVENTION

[0002] The present invention relates to the organic synthesis of chemical compounds and anti-cancer pharmaceuticals, particularly macrocyclic lactones having anti-cancer activity and vacuolar ATPase inhibitory activity and methods of synthesis and use of these compounds.

BACKGROUND OF THE INVENTION

[0003] A number of biological metabolites isolated from natural sources such as sponges, tunicates, and bacteria have been found to have anti-cancer activity. These metabolites are macrocyclic lactones such as salicylihalamide and lobatamide, which appear to represent a new mechanistic class based on their cytotoxicity profiles when compared to other compounds in NCI's standard agents database. Apicularen has also been shown to be cytostatic against human cancer cell lines (Kunze *et al.* (1998)). Macrolides were previously known to have cytotoxic activity and some possess anti-fungal or anti-bacterial properties. The anti-cancer activity of a class of macrolides called salicylihalamide was discovered by Boyd *et al.*, (1997) in a screen of the cytotoxic activity of extracts from a family of sponges (species *Haliclona*). Two novel macrolides, salicylihalamides A and B were purified from the extract and tested in the NCI 60-cell line human tumor screen. Upon screening, these compounds demonstrated a mean-graph profile that was unlike any of the known tumor profiles of known anti-tumor agents. Therefore, these compounds represent a new class of anti-tumor agents. These compounds were especially effective against human solid tumor cell lines. Solid tumors are usually the most resistant to drugs.

[0004] Various other macrocyclic lactones have been identified as having anti-tumor activity. Included are lobatamides (isolated from *Aplidium lobatum*), apicularens (isolated from

Chondromyces), and oximides (isolated from *Pseudomonas*). Lobatamides contain a similar enamide side chain and core structure to salicylihalamides. However, lobatamides contain an oxime methyl ether structure at the end of the enamide side chain. The NCI 60-cell line human tumor screen profile of the lobatamides correlated with the profile of salicylihalamide (McKee *et al.*, (1998)).

[0005] Apicularen A causes a potent growth inhibition of human cancer cell lines, the induction of an apoptotic-like cell death, and the formation of mitotic spindles with multiple spindle poles and clusters of bundled actin from the cytoskeleton (Kunze *et al.*, 1998; Jansen *et al.*, 2000).

[0006] The NCI 60-cell line human tumor screen is a measure of the effectiveness of a compound for inhibiting or killing various human cancers. It is a set of 60 different cancer cell lines against which chemical compounds can be tested against to determine if the compound has anti-cancer activity. Each compound has an individual “fingerprint” based on effectiveness in killing each of the 60 cancer cell lines.

[0001] Fürstner *et al.* (U.S. Patent No. 5,936,100) has used ring closing metathesis as a step in the synthesis of macrocyclic lactones containing one or more polar functional groups. Macrocycles of ring sizes ≥ 12 are challenging to synthesize because the precursors tend to oligomerize.

[0008] The naturally occurring structure of salicylihalamide is unstable under certain conditions. Salicylihalamides decompose in CDCl_3 , due to the unstable side chain (Snider and Song (2000)). The present invention provides macrocyclic lactones which exhibit improved stability over the natural compound. The present invention also includes a process for the

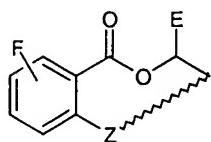

synthesis of these compounds which is particularly flexible for making various compounds. The natural compound has not previously been synthesized and its structure was misidentified when it was purified from marine sponges of the genus *Haliclona*. Boyd *et al.*, in PCT/US98/15011 disclosed the structure of natural salicylihalamide with a negative rotation and assigned the absolute configuration as 12R, 13S, 15R. This assignment was incorrect because the isomer with the 12R, 13S, 15R absolute configuration has a positive rotation and does not have anti-cancer activity, as proven by the inventor in the present application. Only the isomer with the 12S, 13R, 15S absolute configuration has a negative rotation and anti-cancer activity.

[0009] The present invention describes the first synthesis of (+)-and (-)-salicylihalamide A and assigns the absolute configuration of the natural product with negative rotation as 12S, 13R, 15S. It a highly efficient, trans-selective ring-closing olefin metathesis for the assembly of the benzolactone skeleton and has been readily adapted to obtain a variety of analogs.

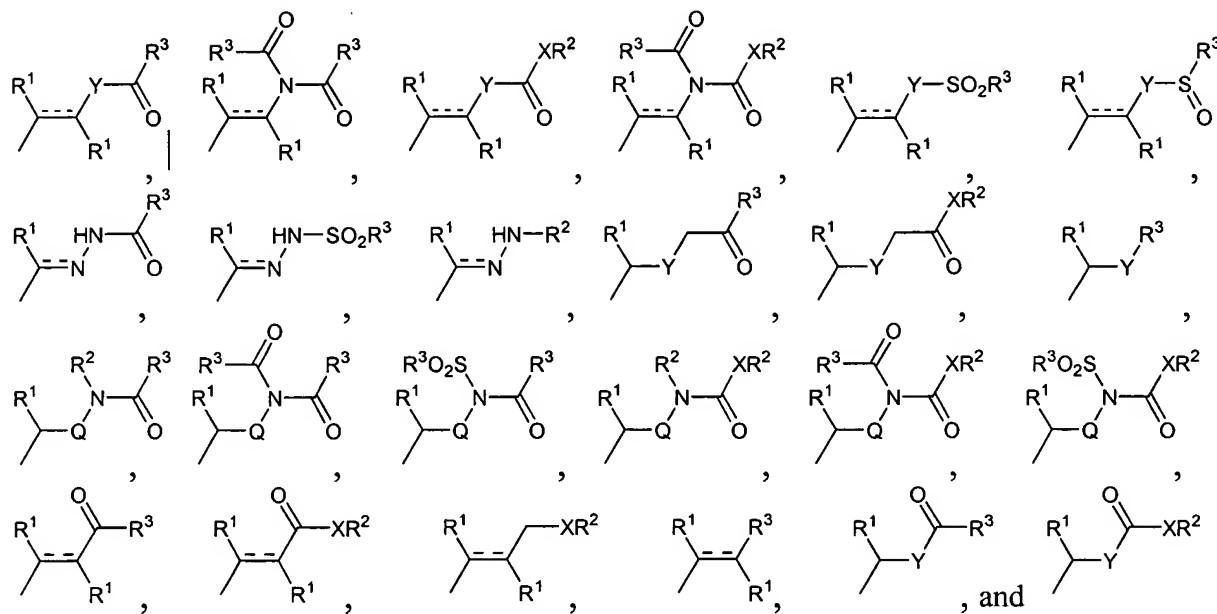

SUMMARY OF THE INVENTION

[0010] The invention includes a method of synthesis of a broad class of cyclic benzolactones with chemotherapeutic activity which exhibit increased stability over natural benzolactones. Included in the invention are the compounds, compositions containing the compounds, methods of synthesis, and methods of treatment.

[0011] An embodiment of the invention is a composition comprising a compound of the formula:

wherein E is

$X = O, S, NR^2; Y = CH_2, O, S, NR^2;$

$Q = O, NH;$

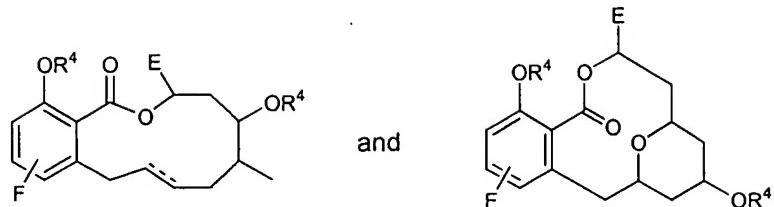

$F =$ ortho, meta, para substituents such as halogen, CN, OR^2 , $OC(O)R^3$, NO_2 , OSO_2R^3 , NR^2R^2 , $NR^2C(O)R^3$, $NR^2SO_2R^3$, R^3 ;

$R^1 = H, Me;$

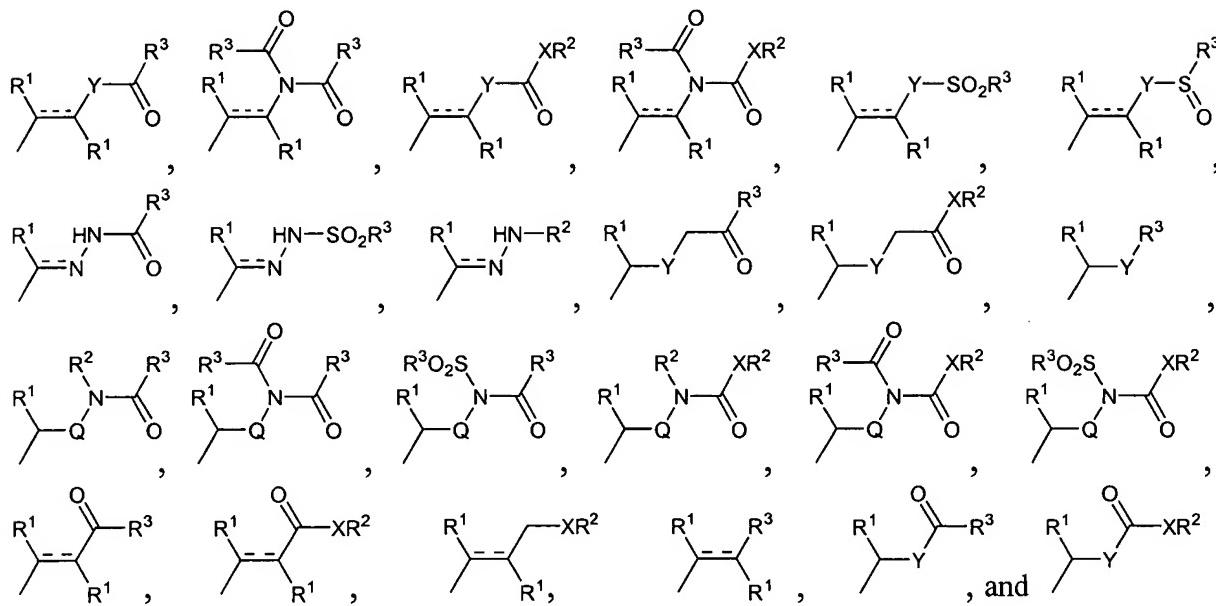

$R^2 = R^1$, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteraryl, heterocycle, CH_2 aryl, CH_2 heteraryl, CH_2 heterocycle, CHR^1CHR^1 aryl, CHR^1CHR^1 heteraryl, CHR^1CHR^1 heterocycle;

$R^3 = R^2$ or $CR^1=CR^1$ aryl, $CR^1=CR^1$ heteraryl, $CR^1=CR^1$ heterocycle, $C\equiv$ Caryl, $C\equiv$ Cheteraryl, $C\equiv$ Cheterocycle; and Z is a contiguous linker whose presence completes an 11 to 15 membered ring. The linker can contain heteroatoms and substituents.

[0012] A further embodiment of the invention are compositions comprising compounds of the formulas:

wherein E is

X = O, S, NR²

Y = CH₂, O, S, NR²

Q = O, NH

F = ortho, meta, para substituents such as halogen, CN, OR², OC(O)R³, NO₂, OSO₂R³, NR²R²,

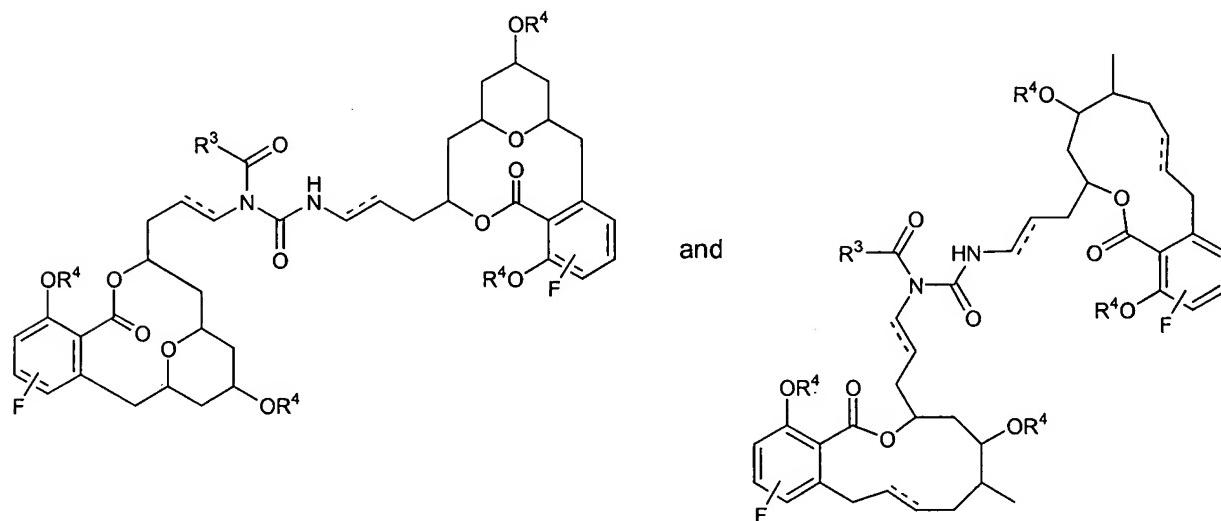

NR²C(O)R³, NR²SO₂R³, R³

R¹ = H, Me

R² = R¹, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteroaryl, heterocycle, CH₂aryl, CH₂heteroaryl, CH₂heterocycle, CHR¹CHR¹aryl, CHR¹CHR¹heteroaryl, CHR¹CHR¹heterocycle

$R^3 = R^2$ or $CR^1=CR^1\text{aryl}$, $CR^1=CR^1\text{heteroaryl}$, $CR^1=CR^1\text{heterocycle}$, $C\equiv\text{Caryl}$, $C\equiv\text{Cheteroaryl}$, $C\equiv\text{Cheterocycle}$; and $R^4 = R^1$, $C(O)R^3$, SO_2R^3 , R^2

[0013] Another embodiment of the invention are compositions comprising compounds of the formulas:

where $F = \text{ortho, meta, para substituents such as halogen, CN, OR}^2, \text{OC(O)R}^3, \text{NO}_2, \text{OSO}_2\text{R}^3, \text{NR}^2\text{R}^2, \text{NR}^2\text{C(O)R}^3, \text{NR}^2\text{SO}_2\text{R}^3, \text{R}^3$;

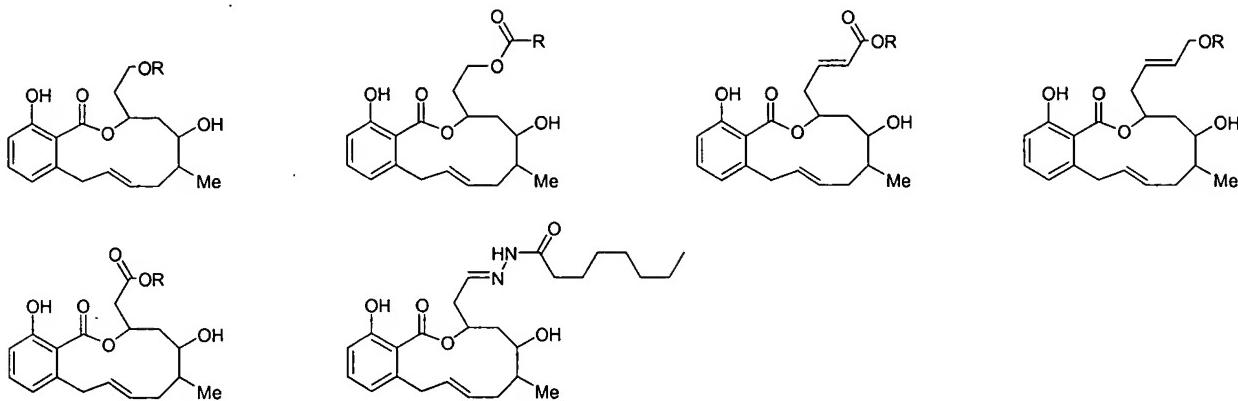

$R^1 = \text{H, Me}$;

$R^2 = R^1$, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteroaryl, heterocycle, CH_2aryl , $\text{CH}_2\text{heteroaryl}$, $\text{CH}_2\text{heterocycle}$, $CHR^1\text{CHR}^1\text{aryl}$, $CHR^1\text{CHR}^1\text{heteroaryl}$, $CHR^1\text{CHR}^1\text{heterocycle}$;

$R^3 = R^2$ or $CR^1=CR^1\text{aryl}$, $CR^1=CR^1\text{heteroaryl}$, $CR^1=CR^1\text{heterocycle}$, $C\equiv\text{Caryl}$, $C\equiv\text{Cheteroaryl}$, $C\equiv\text{Cheterocycle}$; and

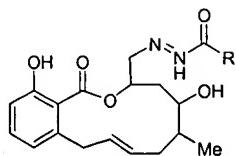

$R^4 = R^1$, $C(O)R^3$, SO_2R^3 , R^2

[0014] An embodiment of the invention is a composition wherein the compound is selected from the group consisting of:

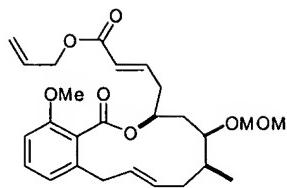

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

[0015] An embodiment of the invention is a composition wherein the compound is of the formula:

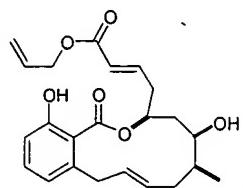

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

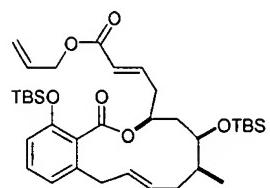

[0016] An embodiment of the invention is a composition comprising a compound of the formula:

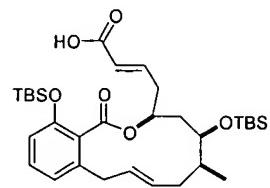

[0017] An embodiment of the invention is a composition comprising a compound of the formula:

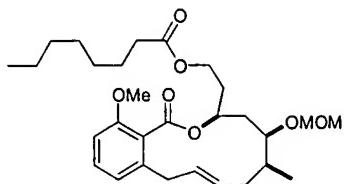

[0018] An embodiment of the invention is a composition comprising a compound of the formula:

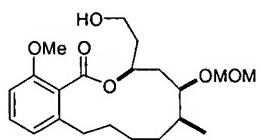

[0019] An embodiment of the invention is a composition comprising a compound of the formula:

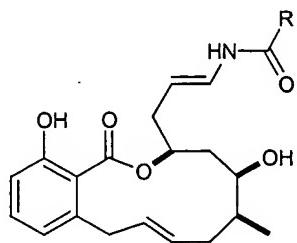

[0020] An embodiment of the invention is a composition comprising a compound of the formula:

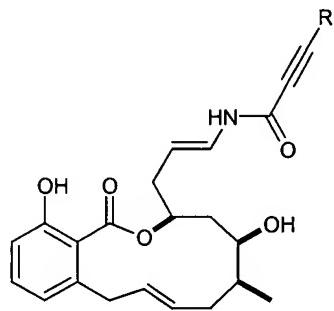

[0021] An embodiment of the invention is a composition comprising a compound of the formula:

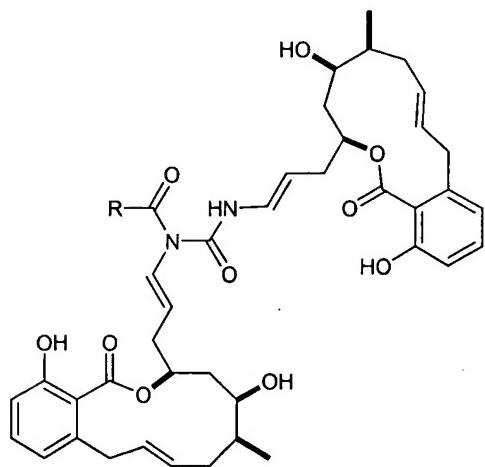

[0022] A further embodiment of the invention is the following compositions comprising compounds of the formulas: (These compounds have been tested for growth inhibitory activities against several cell lines, including human melanoma cell line SK-MEL-5 [*see Example 7; Table 3*], as well as inhibition against reconstituted purified Vacuolar (H^+)-ATPase from bovine brain [*see Example 7; Table 5*]).

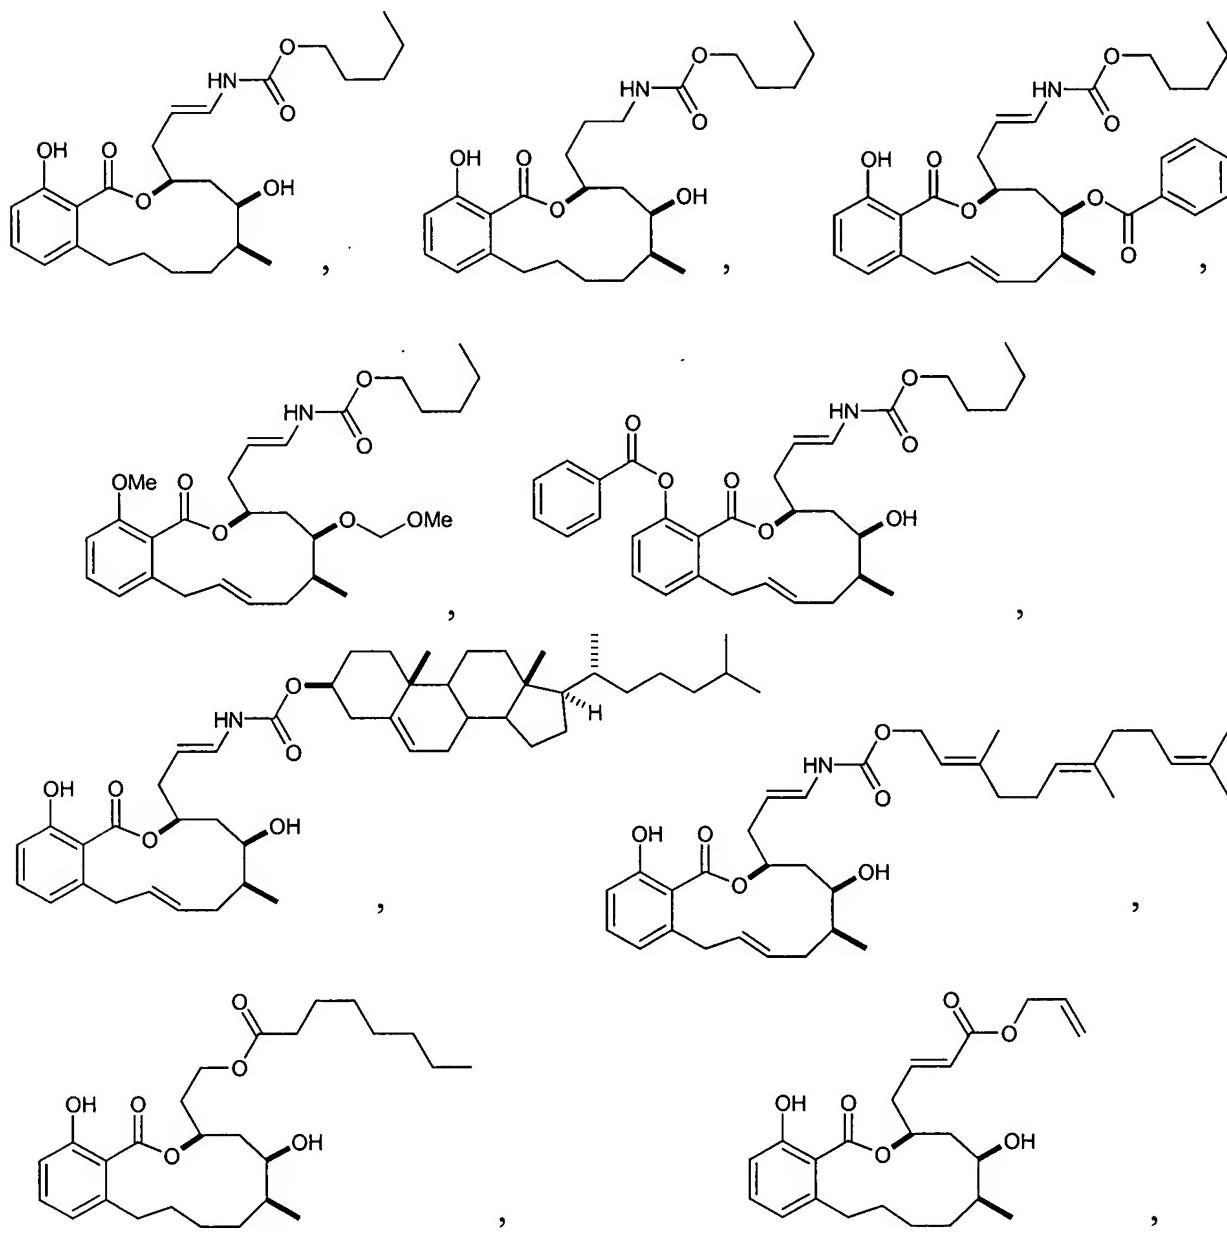

where R = Z,Z-hexadienyl; Z,E-hexadienyl; a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me); a straight chain alcohol (e.g. -O(CH₂)₄Me); and a straight chain diol (e.g. -S(CH₂)₄Me);

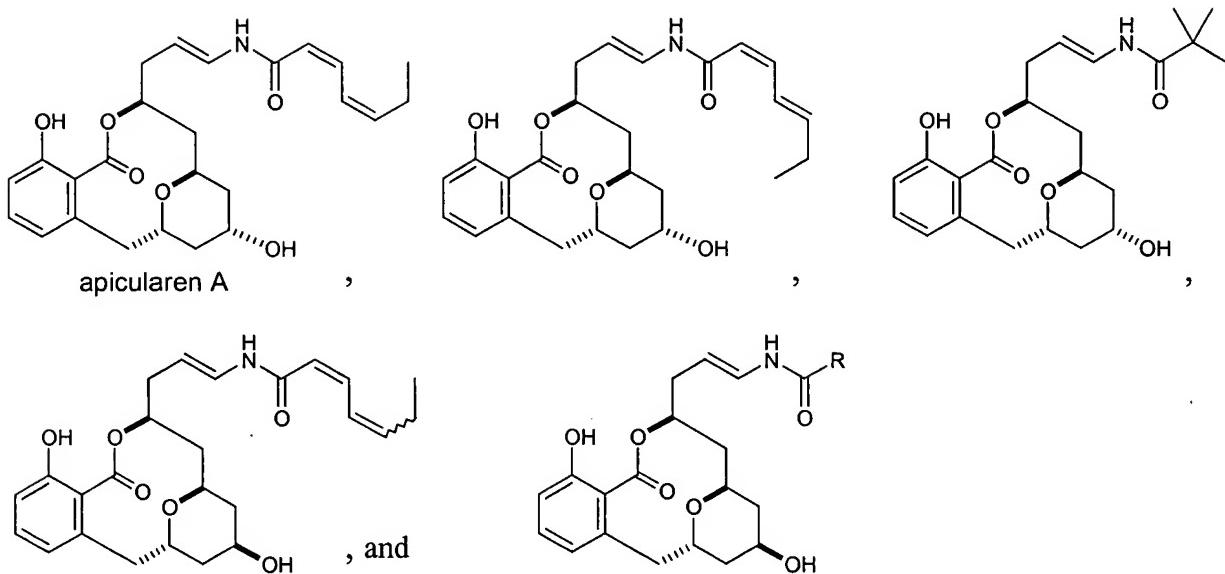

where R = Bu; Ph;

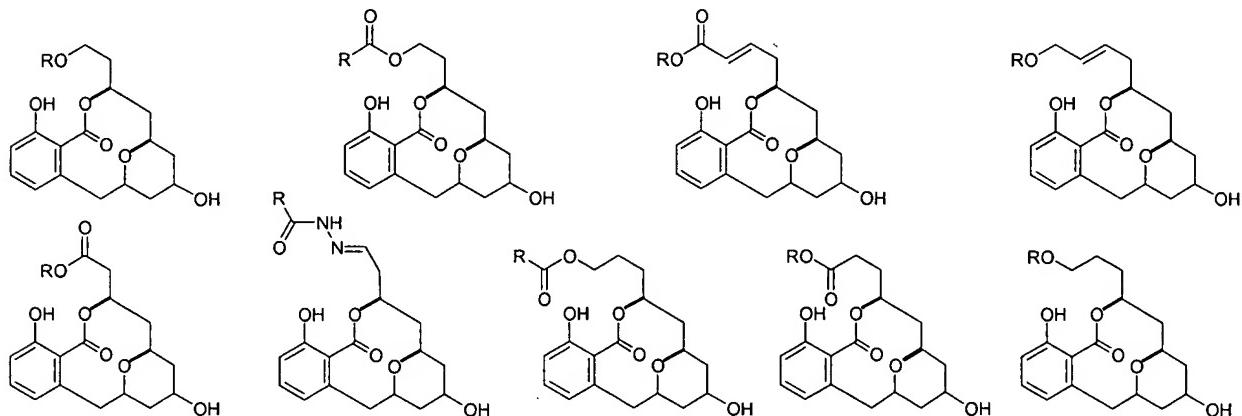

where R = Z,Z-hexadienyl; Z,E-hexadienyl; and a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me);

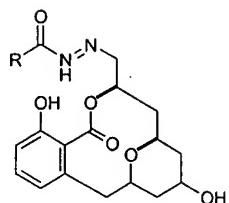

wherein R = a straight chain alkyl comprising 5 to 8 carbons, a straight chain alcohol, a straight chain diol, -CCBu, or -CCph.

[0023] Another embodiment of the invention is a composition wherein the compound is selected from the group consisting of:

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

[0024] Another embodiment of the invention is a composition wherein the compound is of the formula:

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

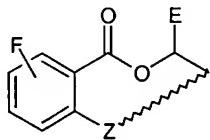

[0025] Yet another embodiment of the invention is a process for preparing a salicylihalamide comprising the steps of: a) synthesis of a benzolactone core; b) synthesis of an enamide side chain; and c) and addition of the side chain by addition of a dienyllithium (28) to the benzolactone core.

[0026] Another embodiment of the invention is a process for preparing a salicylihalamide comprising the steps of: a) synthesis of a benzolactone core; b) synthesis of a side chain; and c) and addition of the side chain to the benzolactone core.

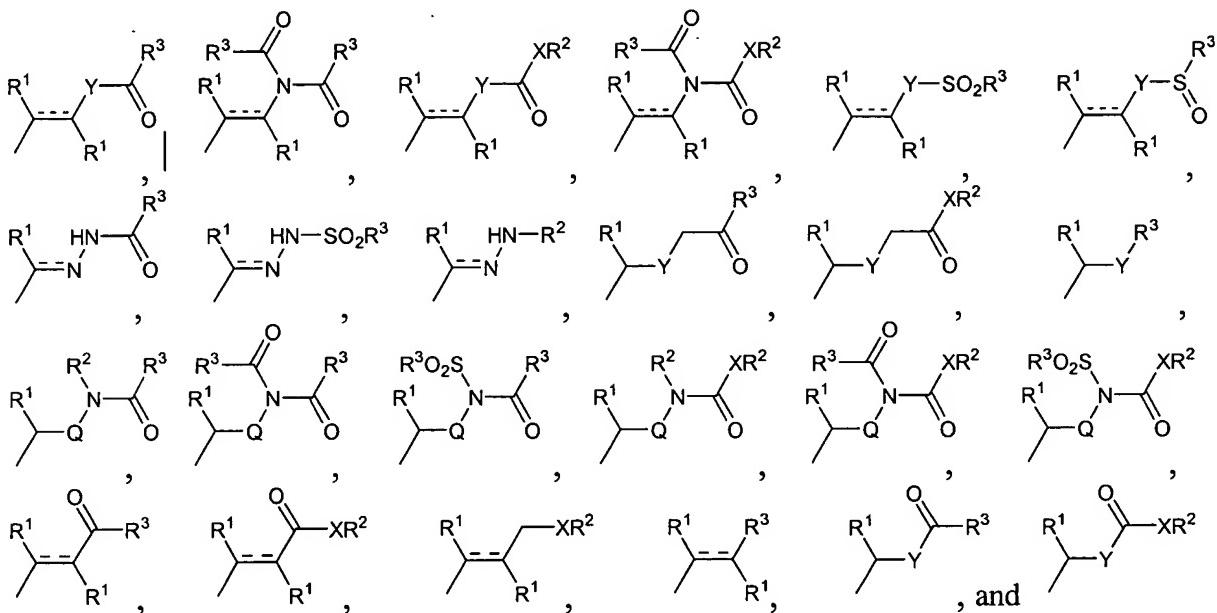

[0027] Still another embodiment of the invention is a process for preparing an Apicularen comprising the steps of: a) synthesis of a benzolactone core; b) synthesis of an enamide side chain; and c) and addition of the side chain by addition of a dienyllithium (28) to the benzolactone core.

[0028] Another embodiment of the invention is a process for preparing an Apicularen comprising the steps of: a) synthesis of a benzolactone core; b) synthesis of a side chain; and c) and addition of the side chain to the benzolactone core.

[0029] Another embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

wherein E is

$X = O, S, NR^2; Y = CH_2, O, S, NR^2;$

$Q = O, NH;$

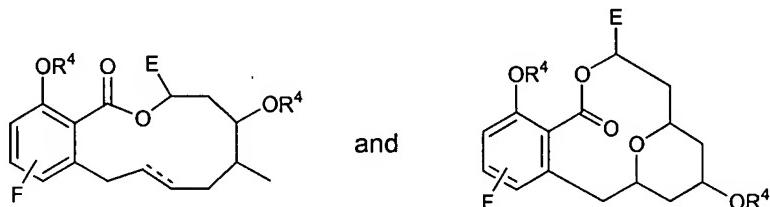

$F = \text{ortho, meta, para substituents such as halogen, CN, OR}^2, OC(O)R^3, NO_2, OSO_2R^3, NR^2R^2,$

$NR^2C(O)R^3, NR^2SO_2R^3, R^3;$

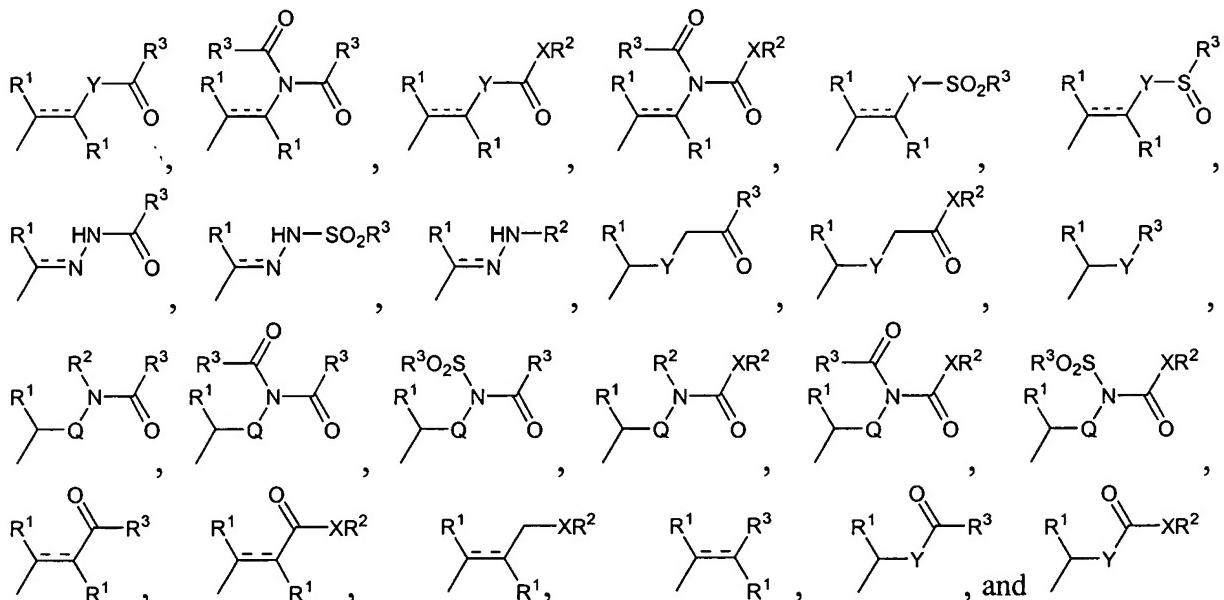

$R^1 = H, Me;$

$R^2 = R^1$, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteroaryl, heterocycle, CH_2 aryl, CH_2 heteroaryl, CH_2 heterocycle, CHR^1CHR^1 aryl, CHR^1CHR^1 heteroaryl, CHR^1CHR^1 heterocycle; $R^3 = R^2$ or $CR^1=CR^1$ aryl, $CR^1=CR^1$ heteroaryl, $CR^1=CR^1$ heterocycle, $C\equiv$ Caryl, $C\equiv$ Cheteroaryl, $C\equiv$ Cheterocycle; and Z is a contiguous linker whose presence completes an 11 to 15 membered ring. The linker can contain heteroatoms and substituents.

[0030] A further embodiment of the invention are compositions comprising compounds of the formulas:

wherein E is

$X = O, S, NR^2$;

$Y = CH_2, O, S, NR^2;$

$Q = O, NH;$

$F =$ ortho, meta, para substituents such as halogen, CN, OR², OC(O)R³, NO₂, OSO₂R³, NR²R², NR²C(O)R³, NR²SO₂R³, R³;

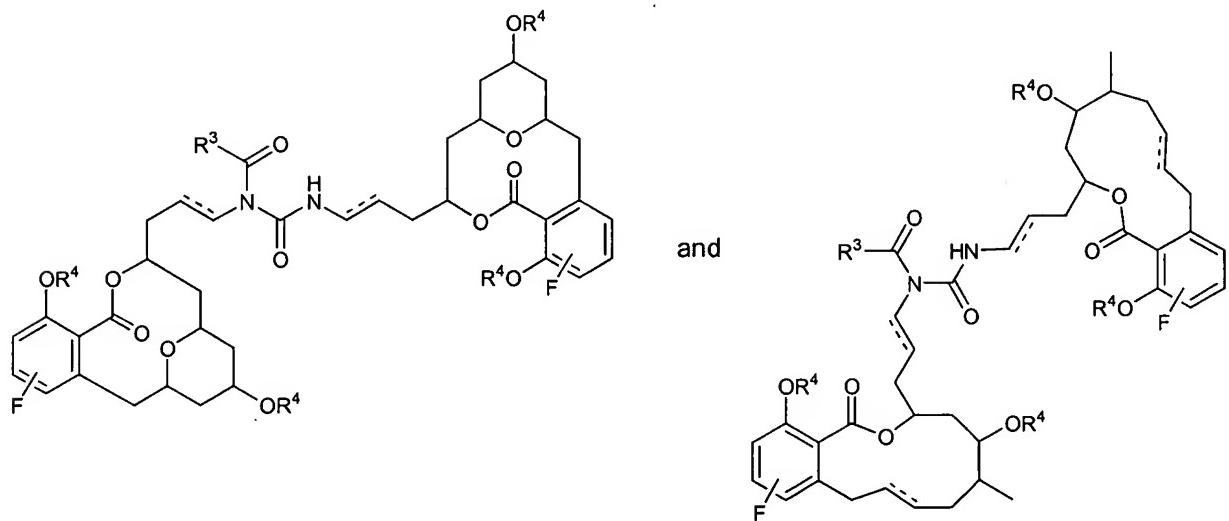

$R^1 = H, Me;$

$R^2 = R^1$, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteroaryl, heterocycle, CH₂aryl, CH₂heteroaryl, CH₂heterocycle, CHR¹CHR¹aryl, CHR¹CHR¹heteroaryl, CHR¹CHR¹heterocycle

$R^3 = R^2$ or CR¹=CR¹aryl, CR¹=CR¹heteroaryl, CR¹=CR¹heterocycle, C≡Caryl, C≡Cheteroaryl, C≡Cheterocycle; and

$R^4 = R^1, C(O)R^3, SO_2R^3, R^2.$

[0031] Another embodiment of the invention are compositions comprising compounds of the formulas:

where F = ortho, meta, para substituents such as halogen, CN, OR², OC(O)R³, NO₂, OSO₂R³, NR²R², NR²C(O)R³, NR²SO₂R³, R³;

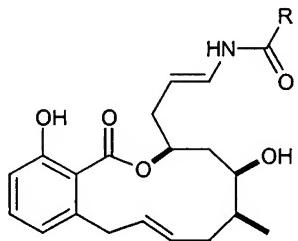

R¹ = H, Me;

R² = R¹, straight chain saturated alkyl, straight chain unsaturated alkyl, branched chain alkyl, branched chain unsaturated alkyl, cycloalkyl, aryl, heteroaryl, heterocycle, CH₂aryl, CH₂heteroaryl, CH₂heterocycle, CHR¹CHR¹aryl, CHR¹CHR¹heteroaryl, CHR¹CHR¹heterocycle;

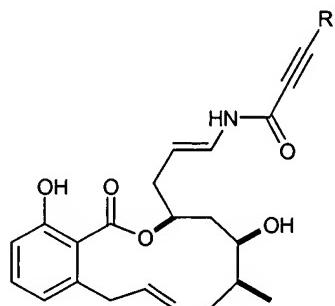

R³ = R² or CR¹=CR¹aryl, CR¹=CR¹heteroaryl, CR¹=CR¹heterocycle, C≡Caryl, C≡Cheteroaryl,

C≡Cheterocycle; and

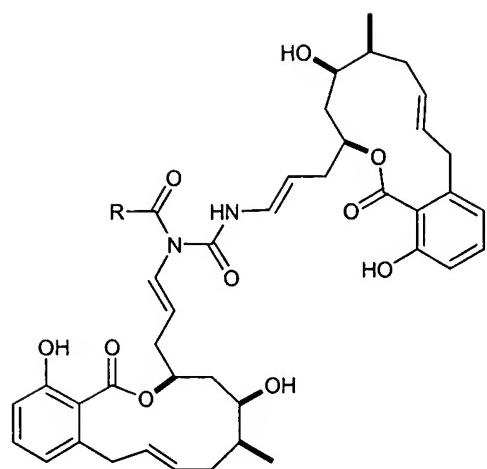

R⁴ = R¹, C(O)R³, SO₂R³, R²;

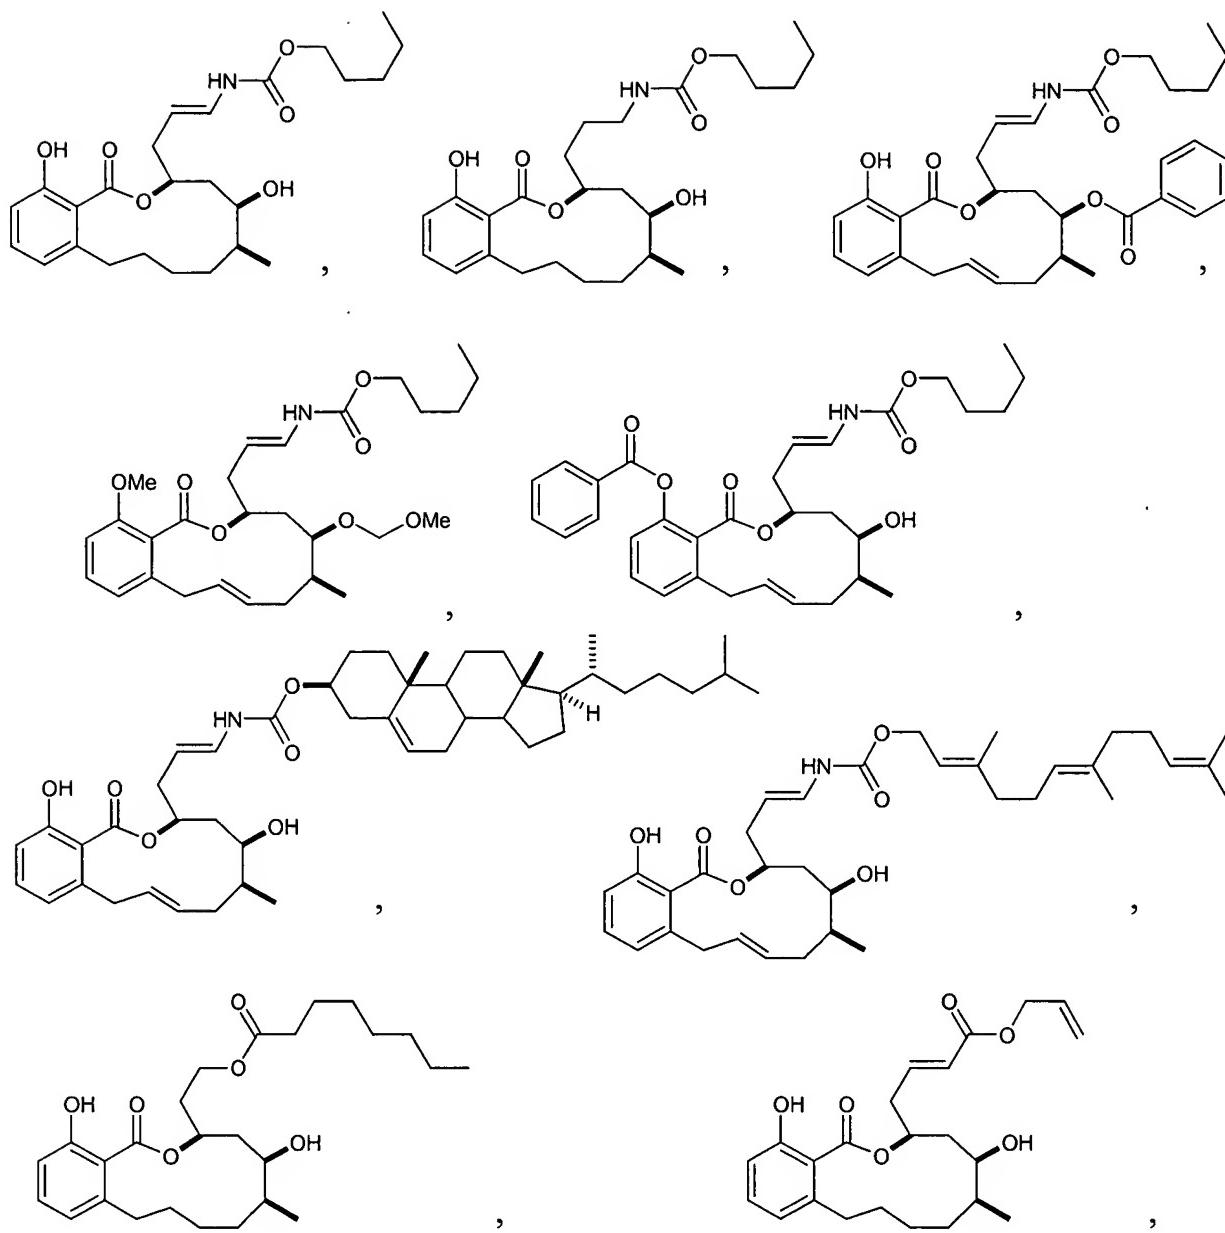

where R = Z,Z-hexadienyl; Z,E-hexadienyl; a straight chain alkyl comprising 5 to 8 carbons, a straight chain alcohol or a straight chain diol.

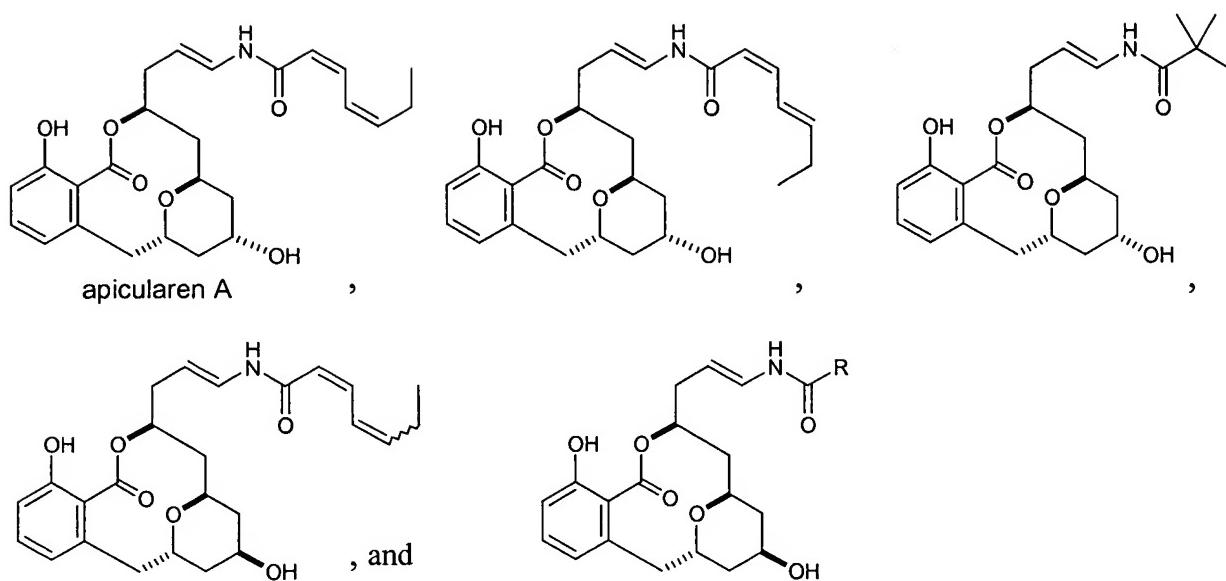

where R = Bu; Ph;

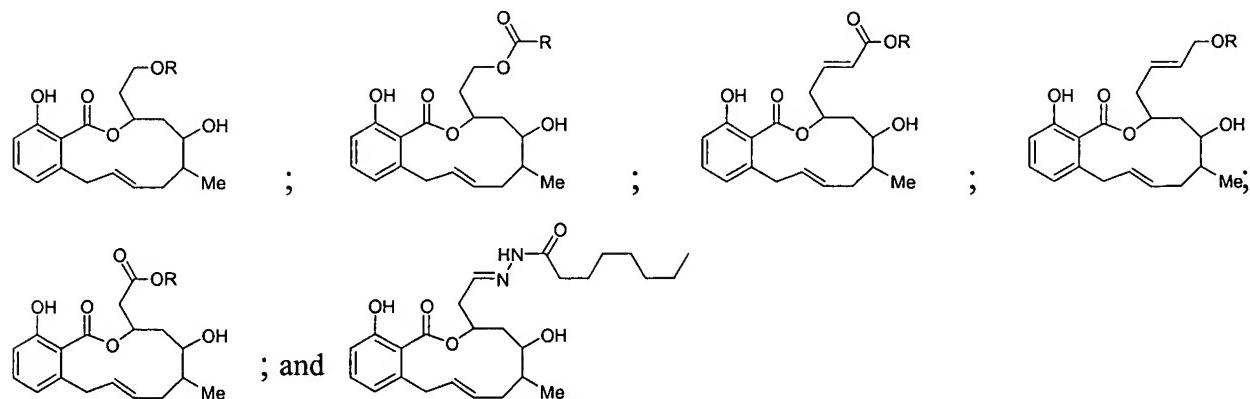

where R = Z,Z-hexadienyl; Z,E-hexadienyl; and a straight chain alkyl comprising 5 to 8 carbons;

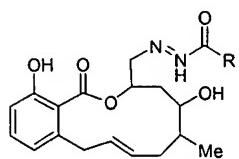

where R = a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me), a straight chain alcohol (e.g. -O(CH₂)₄Me), a straight chain diol (e.g. -S(CH₂)₄Me), -CCBu, or -CCph.

[0032] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula selected from the group consisting of:

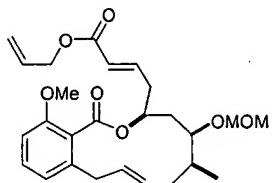

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

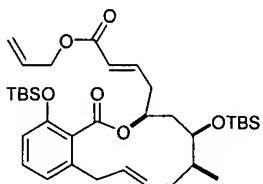

[0033] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

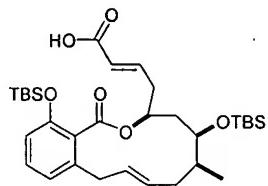

[0034] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

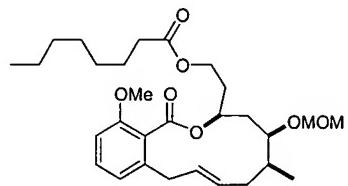

[0035] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

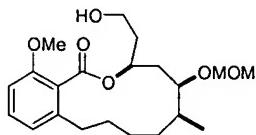

[0036] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

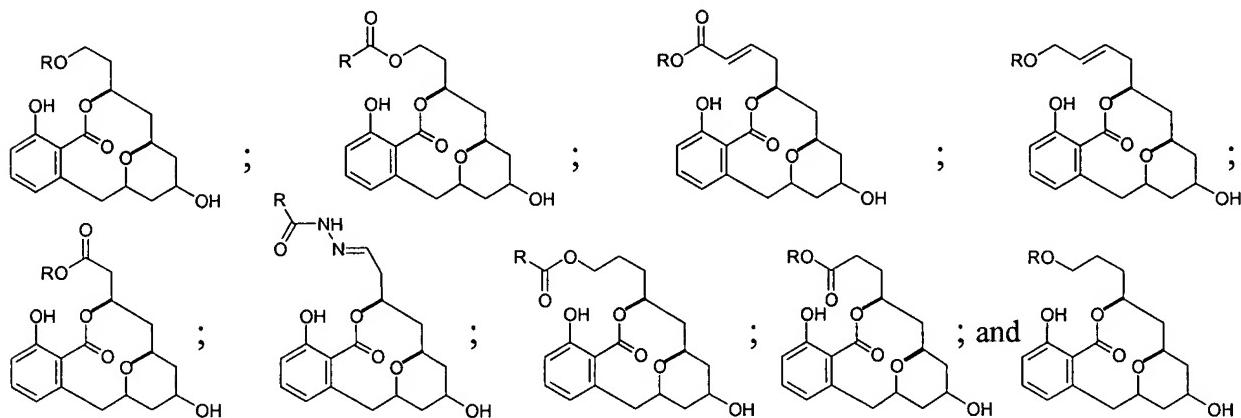

[0037] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

[0038] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

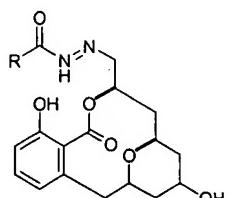

[0039] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula selected from the group consisting of:

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

[0040] An embodiment of the invention is a method of treating or preventing cancer, comprising the step of administering to a patient a therapeutically effective amount of a compound of the formula:

wherein R = straight chain saturated alkyl or straight chain unsaturated alkyl that is comprised of a chain of 5 to 8 carbons.

[0041] An embodiment of the invention is a method for treating cancer comprising the step of contacting a tumor cell within a subject with a macrocyclic lactone of the present invention under conditions permitting the uptake of said macrocyclic lactone by said tumor cell. The tumor cell may be derived from a tissue selected from the group consisting of brain, lung, liver, spleen, kidney, lymph node, small intestine, blood, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head, and neck, esophagus, and bone marrow. In a further embodiment, the subject is human. In another embodiment, the macrocyclic lactone is contained within a liposome. In yet another embodiment, the macrocyclic lactone is administered intratumorally, in the tumor vasculature, local to the tumor, regional to the tumor, or systemically. In a further embodiment, the method comprises administering a second chemotherapeutic agent to said subject. In a further embodiment, the second chemotherapeutic agent may be cisplatin (CDDP), carboplatin, procarbazine, mechlorethamine, cyclophosphamide, camptothecin, ifosfamide, melphalan, chlorambucil, busulfan, nitrosurea, dactinomycin, daunorubicin, doxorubicin, bleomycin, plicomycin, mitomycin, etoposide (VP16), tamoxifen, raloxifene, estrogen receptor binding agents, taxol, gemcitabien, navelbine, farnesyl-protein transferase inhibitors, transplatinum, 5-fluorouracil, vincristin, vinblastin and methotrexate or any analog or derivative variant of the foregoing. In another embodiment, the method further comprises administering radiation to said subject. In another embodiment, the radiation is delivered local to a cancer site. In yet another embodiment, the radiation is whole body radiation. The radiation may be γ -rays, X-rays, accelerated protons, microwave radiation, UV radiation or the directed delivery of radioisotopes to tumor cells. In another embodiment, the method further comprises administering an anticancer gene to said subject. In an embodiment of the invention, the anticancer gene is a tumor suppressor. In another embodiment of the

invention, the anticancer gene is an inhibitor of apoptosis. In another embodiment of the invention, the anticancer gene is an oncogene antisense construct.

[0042] It is a further embodiment of the present invention to provide a method for inhibiting vacuolar ATPase (V-ATPase) proton-pumping activity. The method comprises contacting V-ATPase with the compounds of the present invention in an amount sufficient to inhibit the ATPase proton-pumping activity of the V-ATPase. Inhibition of the V-ATPase proton pumping activity by the compounds of the present invention is useful, *inter alia*, for the treatment and prevention of cancer and osteoporosis.

[0043] An embodiment of the invention is a method for altering the phenotype of a tumor cell comprising the step of contacting the cell with a macrocyclic lactone of the present invention, under conditions permitting the uptake of said macrocyclic lactone by said tumor cell. The tumor cell may be derived from a tissue selected from the group consisting of brain, lung, liver, spleen, kidney, lymph node, small intestine, blood, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head, and neck, esophagus, and bone marrow. In an embodiment of the invention, the phenotype is selected from the group consisting of proliferation, migration, contact inhibition, soft agar growth, cell cycling, invasiveness, tumorigenesis, and metastatic potential. In another embodiment of the invention, the macrocyclic lactone may be contained within a liposome.

[0044] Another embodiment of the invention is a method of treating a subject with cancer comprising the step of administering to said subject a macrocyclic lactone of the present invention under conditions permitting the uptake of said macrocyclic lactone by said cancer cell. In an embodiment of the invention, the subject is human.

[0045] Another embodiment of the invention is a method of suppressing growth of a tumor cell comprising contacting said cell with a macrocyclic lactone of the present invention, under conditions permitting the uptake of said macrocyclic lactone by said tumor cell. In another embodiment, the macrocyclic lactone is contained within a liposome.

[0046] Another embodiment of the invention is a method of regulating cell growth and proliferation in normal and malignant cells, comprising the step of administering, to an individual in need of said treatment, a therapeutically effective amount of a compound of the present invention.

[0047] Another embodiment of the present invention is a method of inhibiting growth of proliferating cells comprising the step of administering, to the proliferating cells, a therapeutically effective amount of a compound of the present invention.

[0048] Other objects, features and advantages of the present invention will become apparent from the following detailed description. It should be understood, however, that the detailed description and the specific examples, while indicating preferred embodiments of the invention, are given by way of illustration only, since various changes and modifications within the spirit and scope of the invention will become apparent to those skilled in the art from this detailed description.

BRIEF SUMMARY OF THE DRAWINGS

[0049] The following drawings form part of the present specification and are included to further demonstrate certain aspects of the present invention. The invention may be better understood by reference to one or more of these drawings in combination with the detailed description of specific embodiments presented herein:

DETAILED DESCRIPTION OF THE INVENTION

[0090] Natural products that elicit a specific and unique biological response in mammalian cells represent valuable tools to identify, study, and target possible new gene products. In this context, the recent isolation of salicylihalamides A and B from the marine sponge *Haliclona sp.* is noteworthy. Pattern-recognition analysis of their unique differential NCI 60-cell mean-graph screening profiles suggests that the salicylihalamides belong to a potentially new mechanistic class of antitumor compounds. Since their discovery in 1997, an emerging class of novel active metabolites have been isolated that structurally relate to the salicylihalamides by virtue of an unprecedented highly unsaturated enamide appended on a macrocyclic benzolactone. These include the mechanistically related lobatamides, the potent cytostatic apicularens, selective inhibitors of oncogene-transformed cells (oximidines), as well as compounds that induce low density lipoprotein (LDL) receptor gene expression. However, the natural forms of these compounds are unstable under certain conditions. The opportunity to develop novel chemistry as well as accessing variants with increased stability, prompted the inventor to undertake the total synthesis of a modified salicylihalamide and modified apicularens. Included is a flexible synthetic strategy, which can be readily adapted to gain access to structural variants, as well as other members of this intriguing class of anti-tumor compounds.

[0013] The inventor has accomplished the first synthesis of both (=)- and (-)-salicylihalamide A. The synthesis utilizes a highly efficient, trans-selective ring-closing olefin metathesis for the assembly of the benzolactone skeleton and can be readily adapted to obtain a variety of analogs. The inventor synthesized the compound of the structure disclosed in Boyd *et al.*, (PCT/US98/15011) and found that the optical rotation of synthetic salicylihalamide A (87) was ($[\alpha]_D = +20$, c , MeOH). The inventor found that this form did not possess anti-cancer

activity. The (+) form was still inactive at 20 μ M whereas natural salicylihalamide ((-) form) is active at 10 nM when tested against SK-MEL-28 cells. This cell line is one of the cell lines in the NCI 60 cell line screen. The inventor then accomplished the first synthesis of (-)-salicylihalamide A. It had a negative optical rotation like that of natural salicylihalamide A $[\alpha]_D = -35, c\ 0.7, \text{MeOH}$ (Erickson *et al.*, 1997). Salicylihalamide A with an (-) optical rotation does possess anti-cancer activity as does natural salicylihalamide, whereas salicylihalamide with a (+) optical rotation does not have chemotherapeutic activity.

[0092] The inventor has determined the absolute configuration of synthetic salicylihalamide (87), suggesting that the absolute configuration of natural salicylihalamide A was misassigned and has to be corrected to the one represented by structure 89. The ultimate proof for this assignment came from a crystallographic analysis of a *p*-bromobenzoate derivative of salicylihalamide 90, prepared from 73 in a manner similar to the synthesis of 74. This structure is shown in FIG. 11. Comparison between synthetic salicylihalamide and natural salicylihalamide show the compounds to be identical in all respects (NMR, mass spectroscopy, IR, TLC (2 solvent systems: 50% ethylacetate in hexanes and 5% methanol in dichloromethane), and HPLC retention times(co-elute on a normal phase silica gel, 5 micron column under 2 different solvent conditions: 3% isopropanol in hexanes and 7% isopropanol in hexanes)) except for their rotations. The synthesis of the absolute configuration has also been accomplished by the inventor. See Examples 7 and 8.

[0093] The present invention also provides for methods/processes of synthesis of the compounds of the present invention which include two equally active routes for its assembly (Fig. 4). One route features an esterification / intramolecular olefin metathesis sequence (RCM) to form the C9-C10 bond and offers the advantage of operational simplicity combined with

functional group tolerance (A1 +B1 gives AB; Path A; Fig. 4). Despite the robustness of the RCM in carbon-carbon bond formation, it can only be implemented successfully for the synthesis of salicylihalamides if concomitant sterocontrol for the desired E-isomer can be exerted. As detailed in full below (Examples 7 and 8), the inventor has identified a highly E-selective RCM avenue to salicylihalamide A. An alternative route involves cross coupling of a sterodefined E-alkenyl organometallic fragment B2 with a bensyl halide A2 and is envisioned to join the C8-C9 bond with control and maintenance of olefin geometry (Path B; Fig. 4). Importantly, both strategies converge to a common alkyne precursor B, adding flexibility to the synthesis. The symbol P in Fig. 4 represents a generic symbol for a hydroxy protecting group.

[0094] For example, the present invention provides for a process for preparing an Apicularen comprising:

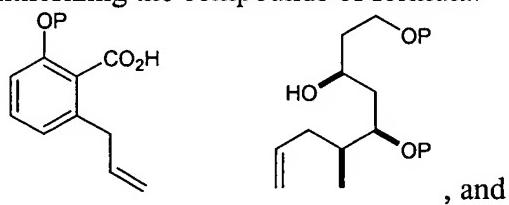

- a) synthesis of an Apicularen benzolactone core; and
- c) addition of a side chain to the Apicularen benzolactone core.

[0095] In addition, the present invention provides for a process for preparing a salicylihalamide comprising:

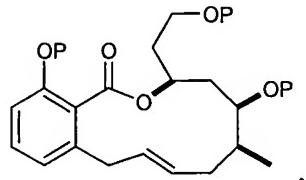

- a) synthesis of a salicylihalamide benzolactone core; and
- b) addition of a side chain to the salicylihalamide benzolactone core.

[0096] In a preferred embodiment, the process for preparing a salicylihalamide comprises:

- (a) synthesizing the compounds of formula:

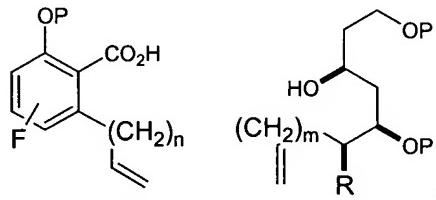

(b) producing from the compounds of step (a), via an ring-closing metathesis, the compound of formula:

wherein P = a hydroxyl protecting group

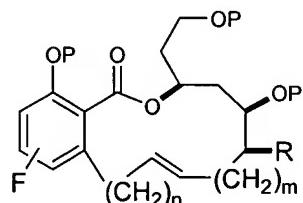

[0097] The process may further comprise:

(i) modifying the compounds of step (a) as follows:

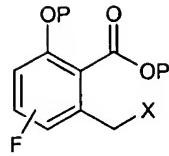

Wherein n = 0, 1, 2, or 3 and m = 1, 2, or 3; R = alkyl; and F = functionality as defined in claim 1; and

(ii) Producing from the compounds in step (a), as defined in step (b) of above, the compounds of formula:

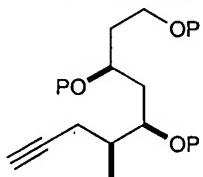

[0098] In a further preferred embodiment, the process for preparing a salicylihalamide comprises:

(a) synthesizing the compound of formula:

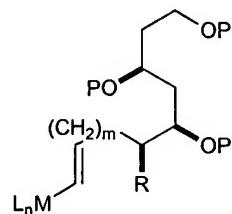

wherein X = I, Br, Cl, OSO₂Aryl; F = functionality as defined in claim 1; and P = a hydroxyl protecting group;

(b) synthesizing the compound of formula:

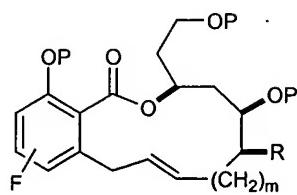

(c) synthesizing from the compound of step (b), via a hydrometallation, the compound of formula:

wherein m = 1, 2, or 3; R = alkyl; P = a hydroxyl protecting group and L_nM is a ligated metal center with M = B, Zn, Zr, Pd, Cu, Li, Sn; and

(d) producing from the compounds of step (a) and (c), via metal-catalyzed cross coupling, the compound of formula:

[0099] In addition to their use as anti-tumor agents, compounds of the present invention have potential for treatment of osteoporosis, a condition in which bone resorption is increased

resulting in weakening of bone. The compounds can be administered alone or in combination with other treatments for osteoporosis. Other treatments for osteoporosis may include, but are not limited to calcium supplements, estrogen replacement for women, and treatment with bisphosphonates or growth factors. The pharmaceutical compositions containing the compounds of the present invention are administered in the manner as described herein.

[00100] Salicylihalamide A exhibits a unique differential cytotoxicity profile in the NCI 60-cell line human tumor assay and represents a novel mechanistic class of antitumor compounds. However, the inherent lability of the enamide side-chain has compromised the development of salicylihalamide-based probe reagents for biochemical analysis. The inventor has synthesized stable functional substitutes of the side-chain. Lobatamides A-F and salicylihalamide A-B are active and gave similar "signatures" in the NCI cancer panel. The inventor realized that the nature of the constituent atoms of the side-chain terminus could be varied (alkylidene vs. methyloxime). Also, the stereochemical nature of the side-chain is unimportant, indicating a non-specific contact, if any, with a putative biological receptor. The inventor has "mutated" the enamide without compromising function. FIG. 22 outlines methods to build a small library of synthetic "salicylihalamides" from common intermediates **105** (ent-73, FIG. 9) and **107**.

[00101] Compounds represented by **106** (ent-74, FIG. 9) are accessible from **105** via Mitsunobu esterification with a variety of carboxylic acids followed by deprotection (BBr_3). Aldehyde **107** is the central handle for olefination chemistry (stabilized and non-stabilized yields) and *N*-acyl hydrazone formation. Compounds **110-113** are representative examples of a larger group of compounds that could be made by varying the R-group in the reagents. Variations on the theme include geranyl ester **115** and allyl esters **109**.

[00102] This method of synthesis is being used to provide new anti-cancer compounds. *See also* Examples 7 and 8. The inventor will use a cell-based cytotoxicity assay to establish structure-activity relationships. Initial hits will be sent to the National Cancer Institute for COMPARE-analysis in the NCI 60-cell line screen. Internal screening against a broad range of primary human lung cancer cell lines will be carried out. The compounds of the present invention have also been tested for their ability to inhibit the growth of tumor cells, including SK-MEL-5, H1299, J2009, H358, J2058, H175 and H1264. *See* Table 3 and Table 4 and Example 7 below.

[00103] Compounds may also be tested for activity in the yeast *Saccharomyces cervisiae*. Yeast-based screening methods are fast and would allow for the identification of salicylihalamide's target via genetic approaches, but only if a yeast homologue exists. Moreover, the complete genome of *Saccharomyces cervisiae* is sequenced and gene-chips are available as powerful tools to look at expression patterns in response to drugs. One of the traditional drawbacks lies in the fact that yeast is relatively impermeable to small-molecule drugs and becomes resistant by overproduction of multidrug resistance pumps. To alleviate potential problems, *Δerg6* mutant strains, displaying reduced multi-drug resistance and more permeability to drugs due to more fluid membranes, will be used.

[00104] The compounds of the present invention can inhibit V-ATPase proton-pumping activity. The V-ATPase proton-pumping inhibitory activity of the compounds of the present invention may be tested as described in Example 7 below (Table 5).

Therefore, the present invention provides a method for inhibiting the proton-pumping activity of V-ATPase by contacting V-ATPase, either *in vitro* or *in vivo* with the compounds of the present invention. Inhibition of the proton-pumping activity of V-ATPase is useful, *inter*

alia, for the treatment and prevention of cancer and osteoporosis. Salicylihalamide A has been shown to inhibit V-ATPase activity in crude membrane preparations of mammalian V-ATPases. See Boyd, M.R. et al., *J. Pharmacol. Exp. Ther.* **297**, 114-120 (2001); see also, PCT publication WO 00/51589 of Boyd et al. V-ATPase is composed of an ATPase domain and a proton translocating membranous channel. The present invention demonstrates, through the use of a purified V-ATPase assay, that the mode of inhibition is through the blocking of the proton-pumping activity (or proton translocation, also known as pore blocking) of V-ATPase and not through its ATP hydrolysis activity. The present invention also demonstrates that the compounds of the present invention bind to the trans-membranous proton channel domain of V-ATPase and not to the ATPase domain. See Crider, Xie and Stone, *J. Biol. Chem.* **269**:17379-17381 (1994) for the experimental procedure for binding. This was shown by incubating select compounds of the present invention with the domains independently and showing that 70% of the channel activity was inhibited at 1 nM of the compound while there was virtually no interference with ATPase activity at the same concentration. See Example 7 and Table 5 below. See also Bill . Crider, Xie and Stone, *J. Biol. Chem.* **269**:17379-17381 (1994).

[00105] Probe reagents for biochemical analysis may be developed by modifying selected positions without compromising function. FIG. 23 outlines some elaborations of side chain-modified congeners. The exact nature of this side-chain (designated as R in FIG. 23) is contingent on the screening results. In addition, Example 7 below describes other chain modifications.

[00106] It is possible to attach probes to, or substitute for, the side-chain. Biotinylation allows cellular localization studies, affinity chromatography and ligand-based gel blotting analysis to be carried out using avidin conjugates. Treatment of alcohol **116** with *N*-(+)-

biotinyl-6-aminocaproic acid *N*-hydroxysuccinimide ester will give biotinylated compound **117**. The corresponding probes for photoaffinity-labeling studies, **118** ($R^1 = B$ or C) can be obtained via acylation with 4-benzoylbenzoic acid *N*-hydroxysuccinimide ester or 4-azidobenzoic acid *N*-hydroxysuccinimide ester, respectively. If these materials are inactivated by the proposed modifications, iodophenol **119** may be used as the starting material for derivatizations emanating from the aromatic ring. Iodophenol **119** can be prepared from **116** (I_2). Selectivity for the para-position is usually observed. Substituting a chloramine T/ $Na^{125}I$ reagent combination for iodine is a method to synthesize radiochemicals. Sonogashira coupling of iodophenol **119** with propargyl alcohol provides a handle (**121**) for introducing biotin (\rightarrow **122**) or photolabels (\rightarrow **123/124**) using the same acylating agents as described above. Radiochemicals are accessible via tritiation (Lindlar, 3H_2). Alkyne libraries (**120**) can be prepared using Sonogashira cross-coupling chemistry.

[00107] The inventor designed a C12-carboxamide as a synthon for the C12-methyl substituent (FIG. 4). To synthesize salicylihalamide analogs and probes otherwise not accessible, the C13-OH in **125** (ent-**64**) will be masked as triisopropylsilylether **126**, followed by reduction of the carboxamide ($LiEt_3BH$). The resulting primary alcohol can be converted to a coupling partner having a latent C12-hydroxymethyl substituent (**121**). Care must be taken to introduce the base-sensitive *o*-NO₂-benzylether. A nitroveratrileether is also a viable alternative. Mitsunobu inversion (acid **32**), treatment with Grubbs' ruthenium carbene complex **57** and oxidative deprotection (DDQ) will provide cyclized material **128**. In close analogy to the manipulations described for **104**, a suitable side-chain (with respect to biological activity), identified through the studies described in FIG. 22, will be introduced (\rightarrow **129**) followed by photodeprotection of the nitrobenzylether (350 nm, MeOH). At this point, the hydroxymethyl

substituent serves its purpose as a handle for obtaining probe reagents **131** (acylation with *N*-hydroxysuccinimide esters as above, followed by desylation of **130**). Finally, similar probes containing an amide linkage (**134**) can be constructed from azide **132** using similar chemistry.

[00108] The inventor has also succeeded in the first and only total synthesis of Apicularen A and a variety of analogs. The synthetic sequence is outlined in **Figures 20 and 43**. For a description, *see Example 4*. The initial lactonization approach of the inventor required the natural configuration at the C15 hydroxyl-bearing center (*15S*) in a 1,3-syn relationship with C13. A reagent-controlled mismatched allylation (double diastereodifferentiation) was used for its formation. The inventor knew from work on salicylihalamides that *ortho*-alkoxy benzoates behave as poor electrophiles in esterification (lactonization) chemistry. Utilizing an intramolecular Mitsunobu inversion as the key ring-forming step could solve both problems. The substrate for this reaction would require an inverted C15 alcohol in a 1,3-anti relationship with respect to C13. The intrinsic facial bias of β -alkoxyaldehydes favors such a relationship in their addition products. Based on numerous precedents, aldehyde **98** would be expected to yield anti-homoallyl alcohol **99** with good stereocontrol by a chelation-controlled ($TiCl_4$) addition of allyltrimethylsilane. Alternatively, the corresponding addition of allenylzinc (prepared *in situ* from propargylbromide and Zn) would yield stereoselectively anti-homopropargyl alcohol **145**. Basic hydrolysis of benzo[1,3]dioxinone **99** will release the carboxylic acid and the C11 hydroxyl functionalities simultaneously. A few scenarios can be envisioned for the subsequent Mitsunobu ring-closure (**135** → **101/102**). The accepted mechanism for the Mitsunobu inversion involves activation of the alcohol to a leaving group ($RCH_2OP^+Ph_3$). The epimeric diol mixture **135a-b** would be expected to give intermediates **136a** and **136b**. Both intermediates could react at C15 (with inversion) to give epimeric benzolactones **101** and **102**, respectively, but the

possibility of a competitive cyclization involving a C11 activated hydroxy group has to be considered. However, only the undesired epimeric intermediate **136b** would be expected to participate – **136a** can not reach the TTS required for an intramolecular SN₂ displacement – resulting in the formation of bridged lactone **137**. Saponification of this material ultimately leads to a net recycling of undesired **135b** to **135a**. Truncated apicularen **101** will be manipulated in multiple ways to generate the natural product as well as a variety of side-chain modified analogs. For example, the ozone adduct of silyl-protected derivative **138** (O₃, -78°C) will be decomposed to aldehyde **139** (Me₂S), alcohol **140** (NaBH₄) and carboxylic acid **141** (H₂O₂), respectively. Apicularen A (**4a**) will be accessed from aldehyde **139** via a sequence similar to the one successfully employed for the synthesis of salicylihalamide A (FIG. 10). Furthermore, compounds **139-141** are functionally equivalent to their corresponding salicylihalamide counterparts **104**, **107** and **114** (FIG. 22), and will be processed in similar ways to deliver side chain-modified apicularen mimics **142-144** (apicularens of general structure **142** are accessible directly from **101** by intermolecular olefin metathesis).

[00109] Finally, alkyne **146** will be prepared from **145** in a manner similar to the one outlined for **101**. The terminal alkyne provides the ideal handle for a Sonogashira cross-coupling to prepare apicularen-based analogs **147**. In addition, the derived stannane **148a** and/or vinyl iodide **148b** will extend the range of cross-coupling reactions to the synthesis of **149** (R = aryl, 1-alkenyl) and enynes **150**. Catalytic hydrogenation of compounds containing a triple bond will provide Z-alkenes (e.g. **151**), potentially radiolabeled (³H₂, Lindlar cat.).

[00110] Examples 7 and 8 below further describe a preferred embodiment of the present invention.

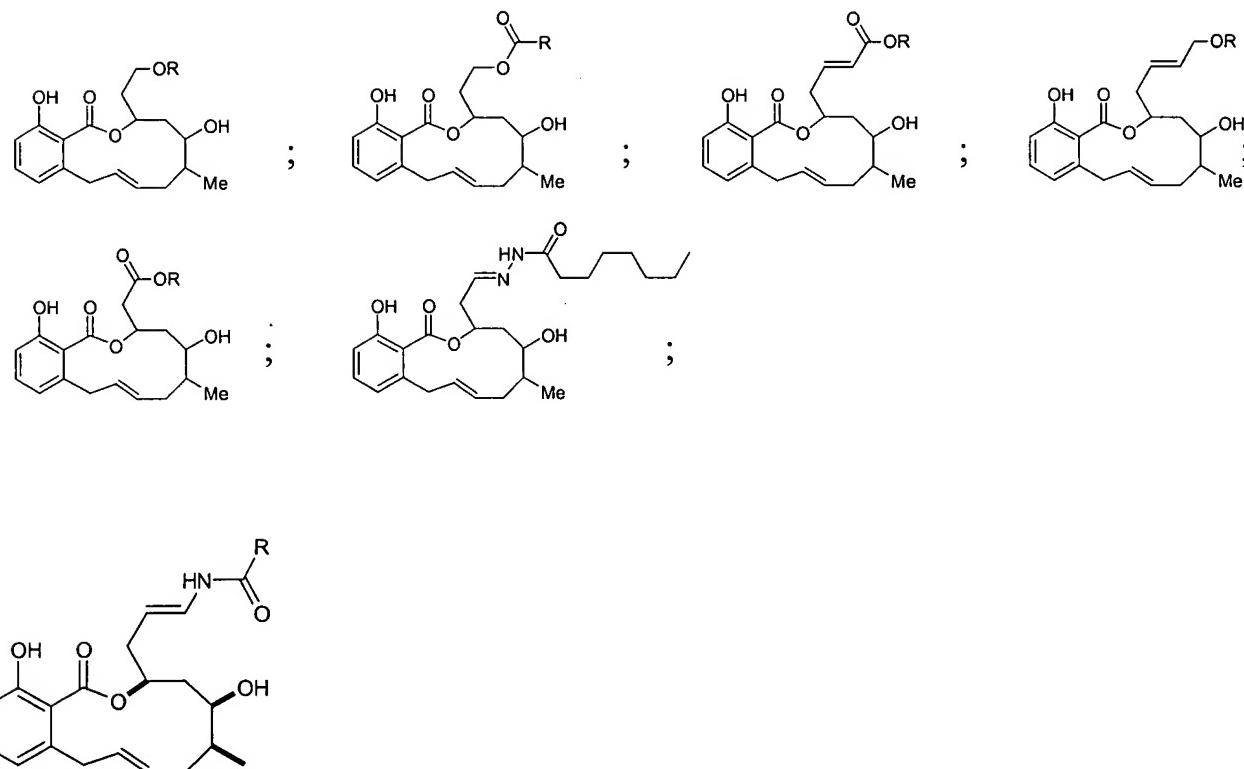

[00111] In the present invention, all structural modifications that are useful as modifications to salicylihalamides are also useful as modifications to apicularens and other macrocyclic lactones.

[00112] X-ray crystallography is the study of the molecular structure of crystalline compounds through X-ray DIFFRACTION techniques. When an X-ray beam bombards a crystal, the atomic structure of the crystal causes the beam to scatter in a specific pattern. This phenomenon, known as X-ray diffraction, occurs when the wavelength of the X rays and the distances between atoms in the crystal are of similar magnitude. X-ray crystallography provides information on the positions of individual atoms in the crystal, the distances between atoms, the angles of the atomic bonds, and other features of molecular geometry. X-ray crystallography is also used to determine the structure of proteins, nucleic acids, and other substances, such as small molecules (<http://www.encyclopedia.com/articles/14056.html> (6/7/00)).

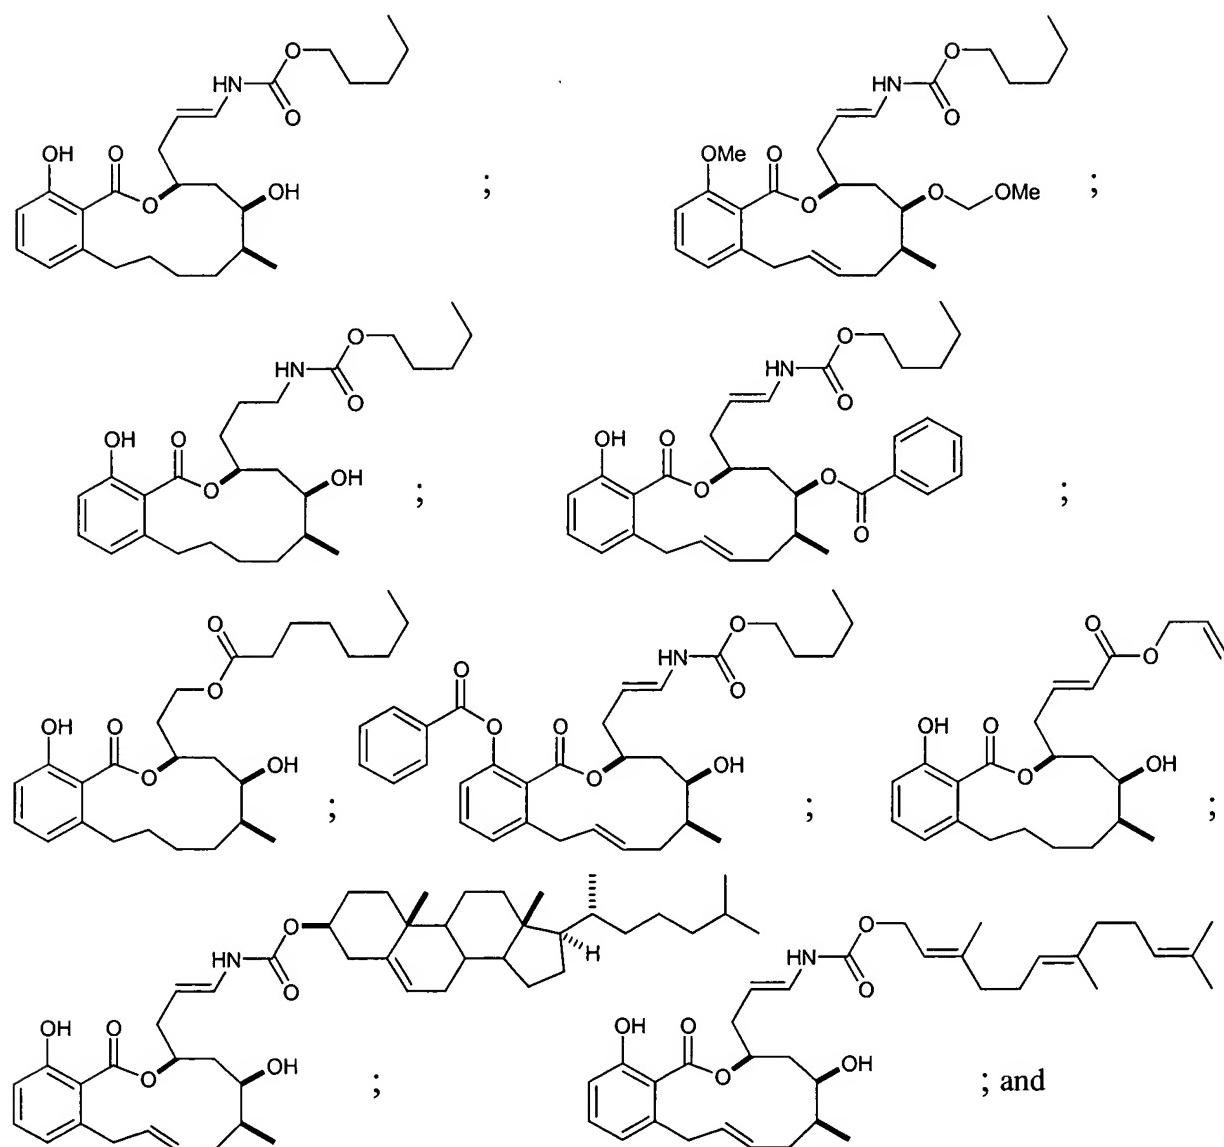

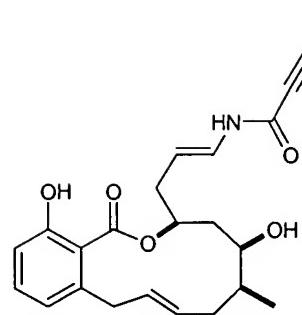

[00113] Mass spectrometers use the difference in mass-to-charge ratio (m/e) of ionized atoms or molecules to separate them from each other. Mass spectrometry is therefore useful for quantitation of atoms or molecules and also for determining chemical and structural information about molecules. Molecules have distinctive fragmentation patterns that provide structural information to identify structural components. The general operation of a mass spectrometer is: create gas-phase ions, separate the ions in space or time based on their mass-to-charge ratio, and measure the quantity of ions of each mass-to-charge ratio (<http://www.scimedia.com/chem-ed/ms/ms-intro.htm>(6/7/00)).

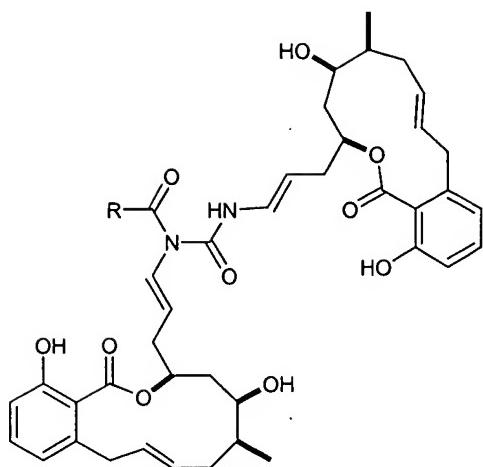

[00114] The temperature used for synthesis is, except where stated to be different, in a range from about -78°C to about 125°C, preferably 0°C to 90°C.

[00115] The term "salicylihalamide derivative" as used herein refers to those structures having a benzolactone core of the same conformation as salicylihalamide. Examples are:

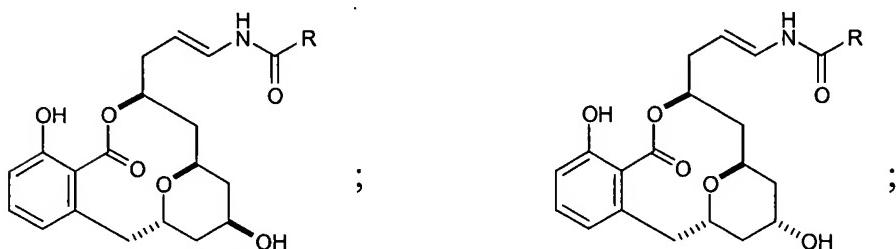

where R = a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me), a straight chain alcohol (e.g. -O(CH₂)₄Me) or a straight chain diol (e.g. -S(CH₂)₄Me);

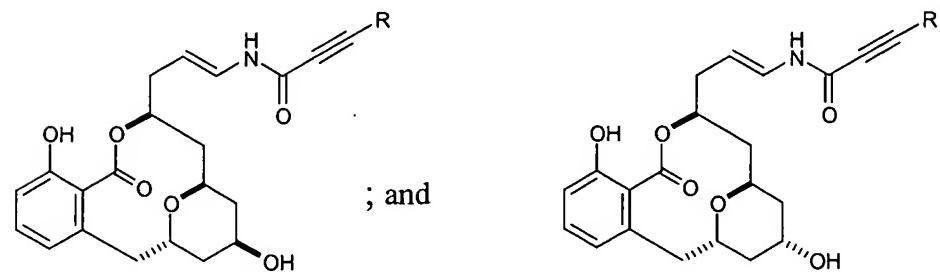

where R = Z,Z-hexadienyl, Z,E-hexadienyl or a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me).

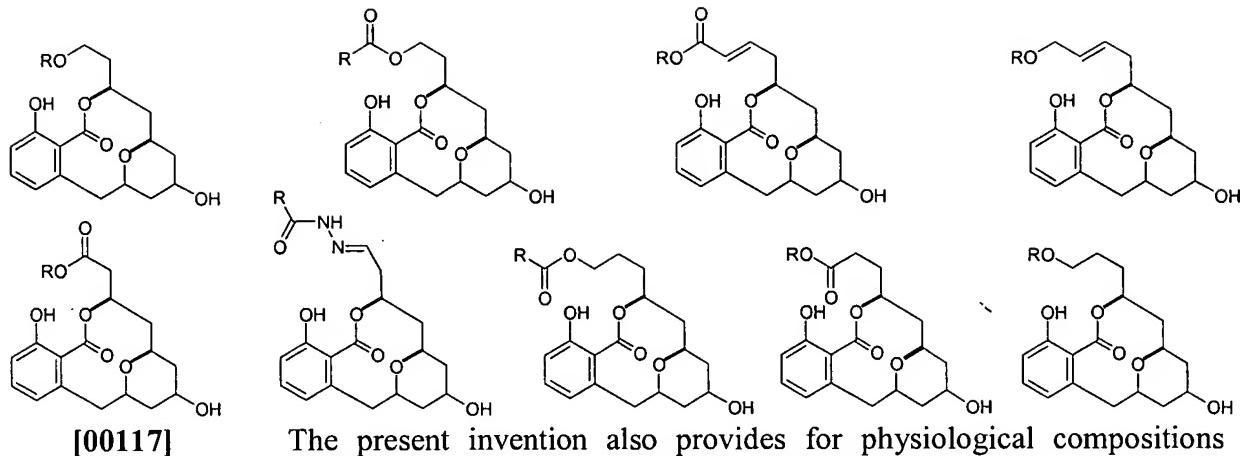

[00116] The term "apicularen derivative" as used herein refers to those structures having a benzolactone core of the same conformation as apicularen. Examples are:

where R = a straight chain alkyl comprising 5 to 8 carbons (e.g. -(CH₂)₅Me), a straight chain alcohol (e.g. -O(CH₂)₄Me) or a straight chain diol (e.g. -S(CH₂)₄Me);

where R = Bu or Ph.

The present invention also provides for physiological compositions

comprising the compounds of the present invention. Aqueous physiological compositions of the present invention comprise an effective amount of a macrocyclic lactone of the present invention or pharmaceutically acceptable salt thereof, dissolved and/or dispersed in a pharmaceutically acceptable carrier and/or aqueous medium.

[00118] The phrases "physiologically, pharmaceutically and/or pharmacologically acceptable" refer to molecular entities and/or compositions that do not produce an adverse, allergic and/or other untoward reaction when administered to an animal.

[00119] As used herein, "physiologically and/or pharmaceutically acceptable carrier" includes any and/or all solvents, dispersion media, coatings, antibacterial and/or antifungal agents, isotonic and/or absorption delaying agents and/or the like. The use of such media and/or agents for pharmaceutical active substances is well known in the art. Except insofar as any conventional media and/or agent is incompatible with the active ingredient, its use in the therapeutic compositions is contemplated. Supplementary active ingredients can also be

incorporated into the compositions. For human administration, preparations should meet sterility, pyrogenicity, general safety and/or purity standards as required by FDA Office of Biologics standards.

[00120] The biological material should be extensively dialyzed to remove undesired small molecular weight molecules and/or lyophilized for more ready formulation into a desired vehicle, where appropriate. The active compounds may generally be formulated for parenteral administration, *e.g.*, formulated for injection via the intravenous, intramuscular, subcutaneous, intralesional, and/or even intraperitoneal routes. The preparation of aqueous compositions that contain a therapeutically effective amount of the macrocyclic lactones of the invention or pharmaceutically acceptable salts thereof as an active component and/or ingredient will be known to those of skill in the art in light of the present disclosure. Typically, such compositions can be prepared as injectables, either as liquid solutions and/or suspensions; solid forms suitable for using to prepare solutions and/or suspensions upon the addition of a liquid prior to injection can also be prepared; and/or the preparations can also be emulsified.

[00121] The pharmaceutical forms suitable for injectable use include sterile aqueous solutions and/or dispersions; formulations including sesame oil, peanut oil and/or aqueous propylene glycol; and/or sterile powders for the extemporaneous preparation of sterile injectable solutions and/or dispersions. In all cases the form must be sterile and/or must be fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and/or storage and/or must be preserved against the contaminating action of microorganisms, such as bacteria and/or fungi.

[00122] Solutions of the active compounds as free base and/or pharmacologically acceptable salts can be prepared in water suitably mixed with a surfactant, such as

hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, and/or mixtures thereof and/or in oils. Under ordinary conditions of storage and/or use, these preparations contain a preservative to prevent the growth of microorganisms.

[00123] Macrocyclic lactones of the present invention can be formulated into a composition in a neutral and/or salt form. Pharmaceutically acceptable salts, include the acid addition salts and/or which are formed with inorganic acids such as, for example, hydrochloric and/or phosphoric acids, and/or such organic acids as acetic, oxalic, tartaric, mandelic, and/or the like.

[00124] The carrier can also be a solvent and/or dispersion medium containing, for example, water, ethanol, polyol (for example, glycerol, propylene glycol, and/or liquid polyethylene glycol, and/or the like), suitable mixtures thereof, and/or vegetable oils. The proper fluidity can be maintained, for example, by the use of a coating, such as lecithin, by the maintenance of the required particle size in the case of dispersion and/or by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and/or antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and/or the like. In many cases, it will be preferable to include isotonic agents, for example, sugars and/or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and/or gelatin.

[00125] Sterile injectable solutions are prepared by incorporating the active compounds in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the various sterilized active ingredients into a sterile

vehicle which contains the basic dispersion medium and/or the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum-drying and/or freeze-drying techniques which yield a powder of the active ingredient plus any additional desired ingredient from a previously sterile-filtered solution thereof. The preparation of more, and/or highly, concentrated solutions for direct injection is also contemplated, where the use of DMSO as solvent is envisioned to result in extremely rapid penetration, delivering high concentrations of the active agents to a small tumor area.

[00126] Upon formulation, solutions will be administered in a manner compatible with the dosage formulation and/or in such amount as is therapeutically effective. The formulations are easily administered in a variety of dosage forms, such as the type of injectable solutions described above, but drug release capsules and/or the like can also be employed.

[00127] For parenteral administration in an aqueous solution, for example, the solution should be suitably buffered if necessary and/or the liquid diluent first rendered isotonic with sufficient saline and/or glucose. These particular aqueous solutions are especially suitable for intravenous, intramuscular, subcutaneous and/or intraperitoneal administration. In this connection, sterile aqueous media which can be employed will be known to those of skill in the art in light of the present disclosure. For example, one dosage could be dissolved in 1 ml of isotonic NaCl solution and/or either added to 1000 ml of hypodermoclysis fluid and/or injected at the proposed site of infusion, (see for example, "Remington's Pharmaceutical Sciences" 15th Edition, pages 1035-1038 and/or 1570-1580). Some variation in dosage will necessarily occur depending on the condition of the subject being treated. The person responsible for administration will, in any event, determine the appropriate dose for the individual subject.

[00128] The macrocyclic lactones of the present invention may be formulated within a therapeutic mixture to comprise about 0.0001 to 1.0 milligrams, and/or about 0.001 to 0.1 milligrams, and/or about 0.1 to 1.0 and/or even about 10 milligrams per dose and/or so. Multiple doses can also be administered.

[00129] Various routes of administration are contemplated for various tumor types. For practically any tumor, systemic delivery is contemplated. This will prove especially important for attacking microscopic or metastatic cancer. Where discrete tumor mass may be identified, a variety of direct, local and regional approaches may be taken. For example, the tumor may be directly injected with the macrocyclic lactone. A tumor bed may be treated prior to, during or after resection. Following resection, one could deliver the macrocyclic lactone by a catheter left in place following surgery. One may utilize the tumor vasculature to introduce the macrocyclic lactone into the tumor by injecting a supporting vein or artery. A more distal blood supply route also may be utilized.

[00130] In addition to the compounds formulated for parenteral administration, such as intravenous and/or intramuscular injection, other pharmaceutically acceptable forms include, *e.g.*, tablets and/or other solids for oral administration; liposomal formulations; time release capsules; and/or any other form currently used, including cremes.

[00131] One may also use nasal solutions and/or sprays, aerosols and/or inhalants in the present invention. Nasal solutions are usually aqueous solutions designed to be administered to the nasal passages in drops and/or sprays. Nasal solutions are prepared so that they are similar in many respects to nasal secretions, so that normal ciliary action is maintained. Thus, the aqueous nasal solutions usually are isotonic and/or slightly buffered to maintain a pH of 5.5 to 6.5. In addition, antimicrobial preservatives, similar to those used in ophthalmic preparations, and/or

appropriate drug stabilizers, if required, may be included in the formulation. Various commercial nasal preparations are known and/or include, for example, antibiotics and/or antihistamines and/or are used for asthma prophylaxis.

[00132] Additional formulations which are suitable for other modes of administration include vaginal suppositories and/or pessaries. A rectal pessary and/or suppository may also be used. Suppositories are solid dosage forms of various weights and/or shapes, usually medicated, for insertion into the rectum, vagina and/or the urethra. After insertion, suppositories soften, melt and/or dissolve in the cavity fluids. In general, for suppositories, traditional binders and/or carriers may include, for example, polyalkylene glycols and/or triglycerides; such suppositories may be formed from mixtures containing the active ingredient in the range of 0.5% to 10%, preferably 1%-2%.

[00133] Oral formulations include such normally employed excipients as, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate and/or the like. These compositions take the form of solutions, suspensions, tablets, pills, capsules, sustained release formulations and/or powders. In certain defined embodiments, oral pharmaceutical compositions will comprise an inert diluent and/or assimilable edible carrier, and/or they may be enclosed in hard and/or soft shell gelatin capsule, and/or they may be compressed into tablets, and/or they may be incorporated directly with the food of the diet. For oral therapeutic administration, the active compounds may be incorporated with excipients and/or used in the form of ingestible tablets, buccal tables, troches, capsules, elixirs, suspensions, syrups, wafers, and/or the like. Such compositions and/or preparations should contain at least 0.1% of active compound. The percentage of the compositions and/or preparations may, of course, be varied and/or may conveniently be between

about 2 to about 75% of the weight of the unit, and/or preferably between 25-60%. The amount of active compounds in such therapeutically useful compositions is such that a suitable dosage will be obtained.

[00134] The tablets, troches, pills, capsules and/or the like may also contain the following: a binder, as gum tragacanth, acacia, cornstarch, and/or gelatin; excipients, such as dicalcium phosphate; a disintegrating agent, such as corn starch, potato starch, alginic acid and/or the like; a lubricant, such as magnesium stearate; and/or a sweetening agent, such as sucrose, lactose and/or saccharin may be added and/or a flavoring agent, such as peppermint, oil of wintergreen, and/or cherry flavoring. When the dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier. Various other materials may be present as coatings and/or to otherwise modify the physical form of the dosage unit. For instance, tablets, pills, and/or capsules may be coated with shellac, sugar and/or both. A syrup or elixir may contain the active compounds sucrose as a sweetening agent methyl and/or propylparabens as preservatives, a dye and/or flavoring, such as cherry and/or orange flavor.

[00135] In certain embodiments of the present invention, the use of lipid formulations and/or nanocapsules is contemplated for the introduction of the macrocyclic lactones of the present invention or pharmaceutically acceptable salts thereof into host cells. Lipid formulations and nonocapsules may be prepared by methods well known in the art.

[00136] "Liposome" is a generic term encompassing a variety of single and multilamellar lipid vehicles formed by the generation of enclosed lipid bilayers or aggregates. Liposomes may be characterized as having vesicular structures with a phospholipid bilayer membrane and an inner aqueous medium. Multilamellar liposomes have multiple lipid layers separated by aqueous medium. They form spontaneously when phospholipids are suspended in

an excess of aqueous solution. The lipid components undergo self-rearrangement before the formation of closed structures and entrap water and dissolved solutes between the lipid bilayers (Ghosh and Bachhawat, 1991). However, the present invention also encompasses compositions that have different structures in solution than the normal vesicular structure. For example, the lipids may assume a micellar structure or merely exist as nonuniform aggregates of lipid molecules.

[0013] Liposomes within the scope of the present invention can be prepared in accordance with known laboratory techniques. In one preferred embodiment, liposomes are prepared by mixing liposomal lipids, in a solvent in a container, *e.g.*, a glass, pear-shaped flask. The container should have a volume ten-times greater than the volume of the expected suspension of liposomes. Using a rotary evaporator, the solvent is removed at approximately 40°C under negative pressure. The solvent normally is removed within about 5 min. to 2 hours, depending on the desired volume of the liposomes. The composition can be dried further in a desiccator under vacuum. The dried lipids generally are discarded after about 1 week because of a tendency to deteriorate with time.

[00138] In the alternative, liposomes can be prepared in accordance with other known laboratory procedures: the method of Bangham *et al.* (1965), the contents of which are incorporated herein by reference; the method of Gregoriadis, as described in *DRUG CARRIERS IN BIOLOGY AND MEDICINE*, G. Gregoriadis ed. (1979) pp. 287-341, the contents of which are incorporated herein by reference; the method of Deamer and Uster (1983), the contents of which are incorporated by reference; and the reverse-phase evaporation method as described by Szoka and Papahadjopoulos (1978). The aforementioned methods differ in their respective abilities to entrap aqueous material and their respective aqueous space-to-lipid ratios.

[00139] A physiological composition comprising the liposomes will usually include a sterile, pharmaceutically acceptable carrier or diluent, such as water or saline solution.

[00140] The present invention also provides kits comprising the macrocyclic lactones of the present invention or pharmaceutically acceptable salts thereof. Such kits will generally contain, in suitable container means, a pharmaceutically acceptable formulation of the macrocyclic lactones of the present invention in a pharmaceutically acceptable formulation.

[00141] The container means will generally include at least one vial, test tube, flask, bottle, syringe and/or other container means, into which the macrocyclic lactones of the present invention formulation are placed, preferably, suitably allocated. The kits may also comprise a second container means for containing a sterile, pharmaceutically acceptable buffer and/or other diluent.

[00142] The kits of the present invention will also typically include a means for containing the vials in close confinement for commercial sale, such as, e.g., injection and/or blow-molded plastic containers into which the desired vials are retained.

[00143] Irrespective of the number and/or type of containers, the kits of the invention may also comprise, and/or be packaged with, an instrument for assisting with the injection/administration and/or placement of the ultimate the macrocyclic lactones of the present invention or pharmaceutically acceptable salts thereof within the body of an animal. Such an instrument may be a syringe, pipette, forceps, and/or any such medically approved delivery vehicle.

[00144] In order to increase the effectiveness of the macrocyclic lactones of the present invention, it may be desirable to combine these compositions with other agents effective in the treatment of hyperproliferative disease, such as anti-cancer agents. An “anti-cancer” agent

is capable of negatively affecting cancer in a subject, for example, by killing cancer cells, inducing apoptosis in cancer cells, reducing the growth rate of cancer cells, reducing the incidence or number of metastases, reducing tumor size, inhibiting tumor growth, reducing the blood supply to a tumor or cancer cells, promoting an immune response against cancer cells or a tumor, preventing or inhibiting the progression of cancer, or increasing the lifespan of a subject with cancer. More generally, these other compositions would be provided in a combined amount effective to kill or inhibit proliferation of the cell. This process may involve contacting the cells with the macrocyclic lactones and other agent(s) at the same time. This may be achieved by contacting the cell with a single composition or pharmacological formulation that includes both agents, or by contacting the cell with two distinct compositions or formulations, at the same or different time, wherein one composition includes the macrocyclic lactone and the other includes the second agent(s).

[00145] Cancer therapies may include a variety of combination therapies with both chemical and radiation based treatments. Combination chemotherapies may include, for example, macrocyclic lactones, cisplatin (CDDP), carboplatin, procarbazine, mechlorethamine, cyclophosphamide, camptothecin, ifosfamide, melphalan, chlorambucil, busulfan, nitrosurea, dactinomycin, daunorubicin, doxorubicin, bleomycin, plicomycin, mitomycin, etoposide (VP16), tamoxifen, raloxifene, estrogen receptor binding agents, taxol, gemcitabien, navelbine, farnesyl-protein tansferase inhibitors, transplatinum, 5-fluorouracil, vincristin, vinblastin and methotrexate, or any analog or derivative variant of the foregoing.

[00146] The compounds may also be used together with immunotherapy. Immunotherapeutics, generally, rely on the use of immune effector cells and molecules to target and destroy cancer cells. The immune effector may be, for example, an antibody specific for

some marker on the surface of a tumor cell. The antibody alone may serve as an effector of therapy or it may recruit other cells to actually effect cell killing. The antibody also may be conjugated to a drug or toxin (chemotherapeutic, radionuclide, ricin A chain, cholera toxin, pertussis toxin, *etc.*) and serve merely as a targeting agent. Alternatively, the effector may be a lymphocyte carrying a surface molecule that interacts, either directly or indirectly, with a tumor cell target. Various effector cells include cytotoxic T cells and NK cells.

[00147] In yet another embodiment, the compounds of the present invention may be combined with gene therapy in which a therapeutic polynucleotide is administered before, after, or at the same time as the macrocyclic lactone of the present invention. Delivery of a vector encoding one of the following gene products will have a combined anti-hyperproliferative effect on target tissues. In the following sections, genes which can be used in gene therapy in conjunction with administration of the macrocyclic lactones will be described. For example, the compounds may be administered together with an expression construct comprising a tumor suppressor gene, such as, but not limited to, the p53 and p16 gene.

[00148] Other genes that may be employed according to the present invention include Rb, APC, DCC, NF-1, NF-2, WT-1, MEN-I, MEN-II, zac1, p73, VHL, MMAC1 / PTEN, DBCCR-1, FCC, rsk-3, p27, p27/p16 fusions, p21/p27 fusions, anti-thrombotic genes (*e.g.*, COX-1, TFPI), PGS, Dp, E2F, *ras*, *myc*, *neu*, *raf*, *erb*, *fms*, *trk*, *ret*, *gsp*, *hst*, *abl*, E1A, p300, genes involved in angiogenesis (*e.g.*, VEGF, FGF, thrombospondin, BAI-1, GDAIF, or their receptors) and MCC, the Bcl-2 protein family genes, and ICE-like protease genes.

[00149] Furthermore, the compounds of the present invention may be used in combination with surgery.

[00150] It is contemplated that other agents may be used in combination with the present invention to improve the therapeutic efficacy of treatment. These additional agents include immunomodulatory agents, agents that affect the upregulation of cell surface receptors and GAP junctions, cytostatic and differentiation agents, inhibitors of cell adhesion, or agents that increase the sensitivity of the hyperproliferative cells to apoptotic inducers. Immunomodulatory agents include tumor necrosis factor; interferon alpha, beta, and gamma; IL-2 and other cytokines; F42K and other cytokine analogs; or MIP-1, MIP-1beta, MCP-1, RANTES, and other chemokines. It is further contemplated that the upregulation of cell surface receptors or their ligands such as Fas / Fas ligand, DR4 or DR5 / TRAIL would potentiate the chemotherapeutic abilities of the present invention by establishment of an autocrine or paracrine effect on hyperproliferative cells. Increases intercellular signaling by elevating the number of GAP junctions would increase the anti-hyperproliferative effects on the neighboring hyperproliferative cell population. In other embodiments, cytostatic or differentiation agents can be used in combination with the present invention to improve the anti-hyperproliferative efficacy of the treatments. Inhibitors of cell adhesion are contemplated to improve the efficacy of the present invention. Examples of cell adhesion inhibitors are focal adhesion kinase (FAKs) inhibitors and Lovastatin. It is further contemplated that other agents that increase the sensitivity of a hyperproliferative cell to apoptosis, such as the antibody c225, could be used in combination with the present invention to improve the treatment efficacy.

[00151] Hormonal therapy may also be used in conjunction with the present invention or in combination with any other cancer therapy previously described. The use of hormones may be employed in the treatment of certain cancers such as breast, prostate, ovarian, or cervical cancer to lower the level or block the effects of certain hormones such as testosterone

or estrogen. This treatment is often used in combination with at least one other cancer therapy as a treatment option or to reduce the risk of metastases.

EXAMPLES

[00152] The following examples are included to demonstrate preferred embodiments of the invention. It should be appreciated by those of skill in the art that the techniques disclosed in the examples which follow represent techniques discovered by the inventor to function well in the practice of the invention, and thus can be considered to constitute preferred modes for its practice. However, those of skill in the art should, in light of the present disclosure, appreciate that many changes can be made in the specific embodiments which are disclosed and still obtain a like or similar result without departing from the concept, spirit and scope of the invention. More specifically, it will be apparent that certain agents which are both chemically and physiologically related may be substituted for the agents described herein while the same or similar results would be achieved. All such similar substitutes and modifications apparent to those skilled in the art are deemed to be within the spirit, scope and concept of the invention as defined by the appended claims.

Example 1: Installation of the Enamide Side Chain

[00153] The macrocyclic salicylates of the invention may be decorated with one of two classes of an unsaturated side chain connected via a common enamide linkage. This acid and base sensitive construct was introduced at a late stage in the synthesis (FIG. 1). The inventor felt that the addition of an alkenyllithium **20a** or **20b** to a stereodefined *E*- or *Z*-alkenyl isocyanate **19** would offer the distinct advantage of mild reaction conditions and control of stereochemistry. Isocyanate **19** was derived from the corresponding α,β -unsaturated carboxylic

acid (acyl azide formation / Curtius rearrangement), in turn accessible from a C17 aldehyde **22** via Horner-Wadsworth-Emmons homologation. FIG. 4 shows an example of side chain synthesis.

[00154] The required alkenyllithium fragment for the synthesis of both salicylihalamides and apicularens was derived from the corresponding 1Z, 3Z-hexadienyl halide via transmetalation with *t*-butyllithium. Beginning with a Sonagashira coupling of Z-1-bromobutene (**23**) with trimethylsilylacetylene, enyne **24** was obtained in 93% yield. Exchange of the silyl group with iodine or bromine (NIS or NBS) was accomplished in the presence of AgNO₃. Although bromide **26** was isolated as a pure *Z*-compound, the corresponding iodide **25** had succumbed to partial isomerization of the double bond (*Z:E* = 4:1). This ratio was reversed during the subsequent reduction (i. Cy₂BH, ii. HOAc) of the triple bond in **25** whereas only partial isomerization had occurred during the corresponding reduction of bromide **26** (**28**, *Z:E* = 4:1). The subsequent transmetalation / isocyanate addition not only proceeded without further isomerizations, but effected the crucial key-transformation to obtain *N*-(*E*-styryl)-heptadienamide **30** in high yields.

Example 2: Salicylihalamides: Exploration of Fragment Synthesis and Coupling Protocols

[00155] It was then necessary to synthesize the benzolactone core of the salicylihalamides. A connectivity analysis pointed to two equally attractive routes for its assembly (**31**, FIG. 4). The first one featured an esterification / intramolecular olefin metathesis sequence to form the C9-C10 bond and offered the advantage of operational simplicity combined with functional group tolerance (Path A). However, the efficiency as well as stereoselectivity (*E* vs *Z*) for medium to large ring-forming metatheses are substrate dependent. Alternatively, a

Pd(0)-catalyzed cross coupling of a stereodefined *E*-alkenyl organometallic fragment **35** with benzylic bromide **34** joined the C8-C9 bond with maintenance of olefin geometry (Path B). Importantly, both strategies converged to a common alkyne precursor **36**, adding flexibility to the synthesis. There is versatility in the available options for synthesizing fragment **36** but a particular C12-C13 aldol bond construction was singled out from the outset for the following reasons: (1) absolute and relative stereochemistry can be controlled by the use of camphorsultam auxiliaries, and (2) a functionalized C12-substituent (carboxylate or hydroxymethyl) may prove useful as an additional handle from which to develop molecular probes for mode-of-action studies.

[00156] Although related to salicylic acid, fragments **32** and **34** are not be easily obtained from a salicylic acid precursor. To access benzylic bromide, a *de novo* synthesis from non-aromatic precursors was performed. Indeed, by stirring a mixture of 1-methoxy-1,3-cyclohexadiene (**39**) with ethyl propiolate (**40**) at 170°C, a Diels-Alder reaction takes place (**41**), which is followed by a pericyclic extrusion of ethylene yielding benzoate **42**. A radical bromination completes the synthesis of benzylic bromide **34** in 50% yield for the two step sequence. On the other hand, derivative **32** was obtained from 2,6-dihydroxybenzoic acid (**43**). After preparation of the known aryl triflate **44**, a Stille coupling with allyltributylstannane introduced the *ortho*-allyl substituent in 95% yield. Treatment of this material with the magnesium salt of allyl alcohol induced a transesterification with concomitant release of acetone (\rightarrow **45**). Finally, protection of the phenol and palladium-catalyzed deprotection of the allyl ester provided benzoic acid derivative **32**. This sequence is critical to avoid conjugation of the double bond.

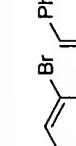

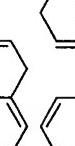

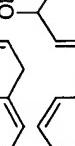

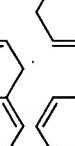

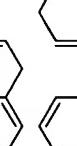

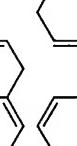

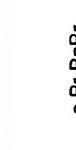

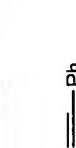

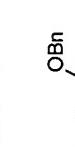

[00157] The synthesis of alkyne **36** starts from readily available aldehyde **47**, prepared in two steps from 1,3-propanediol (i. NaH, THF, *t*-BuMe₂SiCl; ii. (COCl)₂, DMSO, NEt₃, CH₂Cl₂, -78°C). Aldol reaction of aldehyde **47** with the borylenolate derived from 2-*N*-acetylbornanesultam **46** gave a separable mixture of two aldol products, **48** and its epimer, in an 85 : 15 ratio. An X-ray crystallographic analysis of **48** revealed its absolute configuration. Aldehyde **37**, obtained via a one step reduction of protected aldol derivative **49**, was subjected to a stereoselective *syn*-aldol reaction with the titanium enolate derived from (2)-*N*-(4-pentynoyl) bornanesultam **38**. Only a single diastereomer could be detected by ¹H NMR-analysis of the crude reaction mixture. Protection followed by reduction (LiEt₃BH) of the *N*-acyl sulfonamide **51** delivered primary alcohol **52**. Tosylate formation and another reduction (LiEt₃BH) completed the synthesis of fragment **36** (78%, 2 steps).

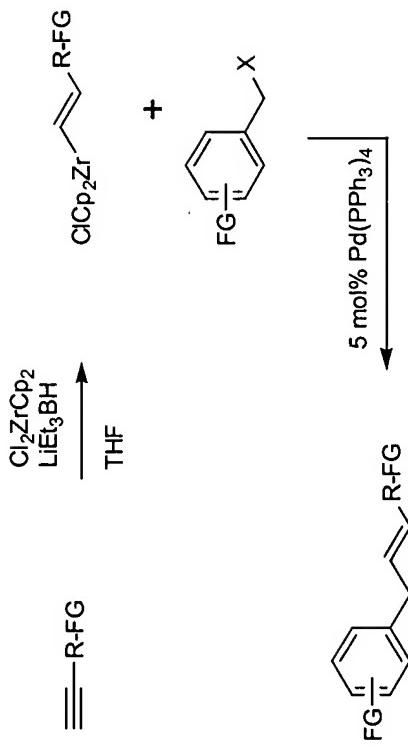

[00158] The assembly of the alkyne **36** with the aryl sector was then achieved (FIG. 8). In one of two approaches, this involved a hydrometallation of the triple bond, followed by cross coupling with benzylic bromide **34** (path B, FIG. 4). In this context, zirconocene **35a** (ML_n = ClCp₂Zr) was considered the most appealing nucleophilic coupling partner. Stereodefined 1-(*E*)-alkenylzirconocenes are readily accessible via a functional group tolerant hydrozirconation and engage in cross-coupling chemistry with a variety of benzyl halides. The use of in situ prepared ClHZrCp₂ (LiEt₃BH, Cl₂ZrCp₂) was critical for obtaining reproducible results. As demonstrated in Table 1, these conditions proved to be general for a variety of alkyne / benzyl halide combinations including the cross coupling with benzyl bromide **34** (entry 6), properly substituted for the synthesis of salicylihalamides. Attempts to obtain zirconocene **35a** via hydrozirconation of alkyne **36** were unsuccessful (FIG. 8). In contrast, alkyne **36** did undergo smooth hydrostannylation (Bu₃SnH, AIBN, toluene) as a prelude to an alternative Stille

coupling with benzylic bromide **34**. The corresponding vinylstannane **35c** was extremely prone to protodesstannylation, yielding terminal alkene **54** upon workup. The desired coupling product **53** could be obtained in a single case via Suzuki cross-coupling in 15% yield. Again, the culprit seemed to be an inefficient hydrometallation as starting alkyne **36** accounted for the remaining mass balance. It is not known why this particular alkyne resists hydrozirconation or hydroboration. Possibly, the particular combination of protecting groups and stereochemistry of **36** could render the alkyne sterically inaccessible to the bulky hydrometallating agents. Clearly, salicylihalamides and variants might still be accessible using this procedure if modified C9-C17 alkyne fragments prove to be better substrates for hydrometallation chemistry.

[00159] A ring-closing olefin metathesis path to salicylihalamides was explored. The *p*-methoxybenzyl protecting group of alkene **54** was oxidatively deprotected (DDQ). The inventor experienced difficulties in the attempts to acylate the resulting alcohol **55** with an acylating agent derived from benzoic acid derivative **32**. The C15 epimer of bis-olefin **56** could not be obtained. This was suspected to be due to increased electron density (*o*-MeO-substituent) at the electrophilic carbonyl center. Indeed, a reactivity umpolung provided by a Mitsunobu esterification (carboxylic acid **32** acting as the nucleophile) was essential and delivered bis-olefin **56** in over 90% yield. Ironically, this material is useless for the synthesis of salicylihalamides due to the inverted configuration at C15 (a consequence of the Mitsunobu inversion). The inventor tested the ability of Grubbs' ruthenium carbene catalyst **57** to effect an intramolecular ring-closing olefin metathesis. Benzolactone **58** was closed in essentially quantitative yield using this approach. A separable mixture of isomers resulted with the Z-isomer predominating (3:1). This is in contrast to the excellent *E*-selectivity observed in the correctly configured diastereomeric series reminiscent of the natural product (*vide infra*).

Example 3: Salicylihalamides: Total Synthesis of Enantiomer with Positive Rotation(Structure Proposed by Boyd et al. in PCT/US98/15011)

[00160] A procedure delivering gram quantities of benzolactone **75** is presented in FIG. 8. The inventor opted for an enantioselective allylation of aldehyde **59** to set absolute stereochemistry at C15. The corresponding homoallyl alcohol **60**, obtained in 96% yield, was protected followed by oxidative double bond-cleavage (72% yield, 3 steps). Treatment of the corresponding aldehyde **62** with the in situ prepared *Z*(*O*)-titanium enolate derived from (*2R*)-*N*-(4-pentenoyl)bornanesultam **63** produced exclusively one diastereomeric aldol product **64** in 95% yield. Protection (\rightarrow **65**), carboxamide reduction (\rightarrow **68**) and fluoride-assisted liberation of the C15 alcohol (\rightarrow **69**) proceeded with high overall yields (61%, 5 steps). Treatment of alcohol **69** with carboxylic acid **32** under Mitsunobu conditions (EtO₂CN=NCO₂Et, PPh₃) yielded bis-olefin **70** (98%), setting the stage for the key intramolecular ring-closing olefin metathesis. In contrast to bis-olefin **56** (*vide supra*), exposure of **70** to a catalytic amount of Grubbs' ruthenium carbene complex **57** preferentially produced the desired *E*-isomer **72** with selectivity of 9-10:1 (*E*:*Z*). Metathesis of the closely related bis-olefin **71** to the corresponding benzolactone **73** under identical conditions was far less selective (*E*/*Z* = 3:1). The inventor has achieved an extremely efficient synthesis of the lactone core of salicylihalamides, delivering gram quantities of primary alcohols **74** or **75** (obtained from **72**/**73** by oxidative deprotection with DDQ) in **35% overall yield** from aldehyde **59** (13 steps). Derivative **74**, designed as a side-chain analog of salicylihalamide (**1a**), provided crystals suitable for X-ray diffraction studies, confirming the assigned structure and stereochemistry (FIG. 11b). Interestingly, the solid-state conformation of the macrolactone **74** differs significantly from the more bowl-like topography found in the solution structure of salicylihalamide A.

[00161] All that remained to complete the total synthesis was the introduction of the side-chain followed by final deprotection. Alcohol **75** was oxidized to aldehyde **76** with Dess-Martin periodinane (DMP) in 93% yield (FIG. 10). Moving forward, aldehyde **76** had to be homologated to α,β -unsaturated carboxylic acid **77**. This was achieved with excellent trans-selectivity by a Horner-Wadsworth-Emmons homologation with trimethylsilyl dimethylphosphonoacetate followed by a slightly acidic aqueous workup. Following acylazide formation (diphenylphosphoryl azide, NEt₃) and Curtius rearrangement (benzene, 80°C), isocyanate **80** was obtained as a chromatographically pure compound. The dienamide side-chain was then installed. Incorporation proceeded smoothly via the addition of hexadienyllithium (**27**, *t*-BuLi; see FIG. 2) to a cold (-78°C) solution of isocyanate **80**. All attempts to remove the protecting groups uniformly met with failure, leading to decomposition. To circumvent this problem, the inventor used a protecting group interconversion at an earlier stage. Carboxylic acid **77** and *t*-butylester **78** were not viable options, yielding intractable mixtures of unidentified materials under the reaction conditions required to remove the protecting groups (BBr₃, CH₂Cl₂, -78°C). In contrast, BBr₃ cleanly removed both methyl and MOM-ether protecting groups of methylester **79** (obtained from **76** as an inseparable mixture of *E/Z*-isomers), after which the corresponding *E*- and *Z*-methylesters **82** and **83** could be separated. Note that **83** is a useful intermediate for the synthesis of salicylihalamide B (**1b**). Hydrolysis (Ba(OH)₂·8H₂O) of the major trans-methylester **82** was followed by complete silylation (TBSCl, DMF, imidazole). Upon workup, silylester hydrolysis had occurred and the corresponding acid **84** was converted to **86** via addition of *Z,Z*-dienyllithium (**28**, *t*-BuLi) to isocyanate **85**. The total synthesis was completed by deprotection of the silylether protecting groups with a 1:1 complex of HF·pyridine in THF, affording synthetic salicylihalamide A (**1**) in x% yield. This material was identical in all

respects (^1H and ^{13}C NMR, IR, UV, MS) to natural salicylihalamide A. However, the optical rotation ($[\alpha]_D = +20$, c , MeOH) of synthetic salicylihalamide A (**87**) was of opposite sign to the one recorded for natural salicylihalamide A ($[\alpha]_D = -35$, c 0.7, MeOH).

[00162] The absolute configuration of natural salicylihalamide A (**1a**) was originally misassigned in Boyd *et al.*, 1997. The correct configuration is represented by structure **89**. The ultimate proof for this assignment came from a crystallographic analysis of a *p*-bromobenzoate derivative of salicylihalamide **90**, prepared from **73** in a manner similar to the synthesis of **74**. The structure is shown in FIG. 11(a). The inventor synthesized (+)-salicylihalamide A and found that it did not have chemotherapeutic activity. (-)-salicylihalamide A does have chemotherapeutic activity. The (+) form was still inactive at 20 μM whereas natural salicylihalamide ((-) form) is active at 10 nM when tested against SK-MEL-28 cells. This cell line is one of the cell lines in the NCI 60 cell line screen.

[00163] The inventor has accomplished the first synthesis of salicylihalamide A. The approach features a highly efficient, trans-selective ring-closing olefin metathesis for the assembly of the benzolactone skeleton and installation of a dienamide side-chain.

Example 4: Apicularens: Synthesis of the Macroyclic Fragment

[00164] The inventor has synthesized apicularen A (**4a**) by the process shown in FIG. 20. Dihydropyranone **94** was considered a useful intermediate from which to build the tetrahydropyranyl ring present in apicularens. The most straightforward approach for its assembly constitutes an enantioselective hetero-Diels–Alder reaction of aldehyde **92** with Danishefsky's diene (1-methoxy-3-(trimethylsilyloxy)butadiene). The ease of catalyst synthesis and high enantioselectivities observed was the reason for using chromium complex **93** for the hetero-Diels–Alder reaction of Danishefsky's diene with aldehyde **92**, obtained via oxidative

cleavage of alkene **91** (an intermediate of the salicylihalamide synthesis). Dihydropyranone **94** was obtained in 60% yield after treatment of the Diels-Alder adducts with trifluoroacetic acid. The enantiomeric excess was determined by chiral HPLC-analysis (CHIRALCEL® OD-H; 84%ee). Copper(I)-catalyzed conjugate addition of vinylmagnesium bromide to this material gave exclusively the 2,6-trans substituted tetrahydropyranone **95**. The next step involved stereoselective ketone reduction and a variety of agents are known that selectively deliver hydride from the pseudoaxial (e.g. NaBH₄ or SmI₂) or pseudoequatorial (L-SELECTRIDE®) position. None of these conditions were successful however, and an inseparable epimeric mixture of alcohols **96** was obtained in all cases. The corresponding ketone most likely exists as an equilibrium mixture of two equally populated conformers. Such a situation would provide an epimeric mixture if both conformers react with comparable rates, even with highly selective reducing agents. This problem could be solved by delaying the reduction until after the macrocyclization provided that this will reduce the conformational flexibility of the tetrahydropyranone ring. In the meantime, the epimeric mixture was silylated followed by hydroboration (BH₃, THF; H₂O₂) of alkene **97** and oxidation of the resulting primary alcohol with TPAP (tetrapropylammonium perruthenate). Completion of the macrocyclic portion of the apicularens entailed an allylation / lactonization sequence. A low selectivity was observed during the reaction of aldehyde **98** with Brown's allyldiisopinocampheylborane, delivering a 77:23 mixture of diastereomeric homoallyl alcohols **99** and **100** (65%). This was not completely unexpected given the intrinsic facial bias of β-alkoxy aldehydes for 1,3-anti addition products. Moreover, 8% of enantiomeric aldehyde **98** was present and would be expected to give product enantiomeric to **99**, further lowering the syn/anti selectivity but increasing the enantiomeric purity of **100**. Treatment of the desired major diastereomer **100** (mixture of C11 epimers) with

NaH effected the crucial lactonization in 70% yield. After silylether removal, epimeric (C11) alcohols **101** and **102** could be separated by chromatography. The chemical shift values and coupling constants of protons H3 through H15 (400 MHz NMR) of **101** are nearly identical to the values reported for apicularen A.

Example 5: Apicularens: Total Synthesis of Apicularen A and Analogs

[00165] The transformation of compounds **101** and **102** [which correspond to **224** and **225** of FIG. 25, respectively] into apicularen A and a variety of analogs is shown in FIG. 25 and follows the general procedures disclosed for the installation of the side chains of salicylihalamide A and analogs (*see* FIG. 13-15 and Examples 7 and 8).

Example 6: Anti-Cancer Activity of Synthetic Salicylihalamides

[00166] The anti-cancer activity of the synthesized (+)- and (-)-salicylihalamide-A compounds of the present invention (compounds **78** in FIG. 10 and **301a/301c** in FIG 14.) was indistinguishable. In contrast, synthetic (+)-salicylihalamide A (compound **87** in FIG 9), the compound with the absolute configuration proposed by Boyd *et al.*, was completely inactive in the same NCI 60-cell line screen. Salicylihalamide derivatives, showing increased stability over natural salicylihalamide, were tested in the NCI 60 cell-line screen. This screen is an art recognized model. Prior to assay, synthesized compounds were stored in dimethylsulfoxide at -70°C. Five different test concentrations of each compound were prepared by diluting the stock solution into complete medium. Sample concentrations were 2x the final concentration and range from 10^{-6} and 10^{-10} molar. An aliquot of each concentration of each compound was added to separate microtiter wells containing the respective cell lines in culture medium. The plates were incubated for 48 hours at 37°C with 5% CO₂ and 100% humidity. Adherent cells were fixed by addition of cold 50% trichloracetic acid and incubation at 4°C for 60 minutes. Suspended cells were fixed to the bottom of the well by addition of 80% trichloracetic acid. The supernatant was removed from each well and then each well was washed with deionized water and allowed to dry. Sulforhodamine B solution was added to each well and allowed to incubate for 10 minutes at room temperature. Unbound sulforhodamine B was removed by washing with 1% acetic acid. The wells were allowed to dry. Bound sulforhodamine B was solubilized using 10 mM Tris base and the optical density at 515 nanometers was determined. The synthesized salicylihalamide derivatives exhibited anti-cancer activity profiles.

[00167] A 1:1 mixture of salicylihalamide A (**1**) and C22-*E* isomer **211**^{3,5d-g} was indistinguishable, within the limits of experimental error, from natural salicylihalamide A based

on comparative testing in the National Cancer Institute 60-Cell Screen.

Example 7: Overall Synthesis Scheme of Synthetic Salicylihalamides

[00168] Compounds **328a** and **328b** (FIG.11) were prepared as described for the corresponding enantiomers **70** and **71** (FIG. 8) by using enantiomeric starting materials. Thus the enantiomers of the lpc2Ballyl reagent and compound **63** (*see* structure **323** in FIG. 11) were used to prepare the **328a** and **328b** (FIG. 11). The lack of a stereopredictive model for the formation of large rings *via* RCM is exemplified by our results with the metathetical ring closure of substrates **328a,b**. *See* Fig. 11. Whereas the diastereomeric substrate **312c** gave the Z-olefin **318Z** (*vide supra*, Scheme 4) as the major isomer, **328b** fortuitously produced the *E*-benzolactone **329a** with an impressive selectivity of 10:1 when subjected to similar reaction conditions. To confuse the issue even more, an initial single experiment with the corresponding phenolic MOM ether **328b** furnished benzolactones **329b** and **330b** with an eroded selectivity of 3:1 upon exposure to catalyst **i**. Fig. 11. In principle, RCM is a reversible reaction but due to the shorter lifetime (thermal instability) of “first generation” Ru-alkylidene catalysts (e.g. **i**) and less efficient reaction with 1,2-disubstituted olefins (reaction products), kinetic product ratios can be expected.

[00169] In light of the above, a detailed study of the RCM of **328a,b** with Ru-alkylidene pre-catalysts **i** and **ii** was conducted. *See* Fig. 13. *N*-Heterocyclic carbene ligated ruthenium alkylidene catalysts have been independently reported by three groups, cf.: (a) Huang, J.; Stevens, E. D.; Nolan, S. P.; Petersen, J. L. *J. Am. Chem. Soc.* **1999**, *121*, 2674-2678. (b) Scholl, M.; Trnka, T. M.; Morgan, J. P.; Grubbs, R. H. *Tetrahedron Lett.* **1999**, *40*, 2247-2250. (c) Ackermann, L.; Fürstner, A.; Weskamp, T.; Kohl, F. J.; Herrmann, W. A. *Tetrahedron Lett.* **1999**, *40*, 4787-4790.

[00170] It is clear from these results that both catalysts are equally efficient in performing the desired transformation, albeit with different degrees of *E/Z*-selectivity. Also, both differentially protected substrates **328a,b** gave identical *E/Z*-ratios under identical reaction conditions. Whereas the pre-catalyst **i** provided a 9:1 (*E*:*Z*) ratio with only a slight erosion of selectivity over time, pre-catalyst **ii** produced a lower 67:33 ratio, which remains constant over time. From these results, we conclude that RCM with catalyst **i** kinetically induces the formation of the desired *E*-isomers **329a,b** with relatively high selectivity. The ratio observed with catalyst **ii** is deemed to be a thermodynamic one based on the following observations: (1) the ratio doesn't change over time, (2) an identical product ratio is observed for the formation of benzolactones **329-330** from both our precursors (**328a,b**), and (3) upon resubmission of either geometrically pure **329a** or **330a** to the same reaction conditions, an identical 67:33 mixture of **329a:330a** was formed.

[00171] Having secured a viable sequence to the benzolactone core of salicylihalamide A, we turned our attention to the installation of the acylated enamine side chain. Towards this end, the *p*-methoxybenzyl ether in **329a** (or **329b**) was oxidatively removed (DDQ) and the resulting alcohol **331a** was oxidized with Dess-Martin periodinane (Fig. 13). Engagement of the resulting aldehyde **332** in a Horner-Wadsworth-Emmons (HWE) homologation with trimethyl phosphonoacetate provided methyl ester **334a** as an inseparable mixture of *E/Z*-isomers in a ratio of 4:1. After removal of the ether protecting groups with BBr₃, the corresponding *E*-methyl ester was separated by flash chromatography, hydrolyzed (Ba(OH)₂·8H₂O) and extensively silylated with excess TBSCl to deliver carboxylic acid **337**. The overall yield for the transformation of **332** to **337** was a disappointing 20-30%. Therefore, a series of optimization experiments were performed that quickly led to the use of allyl

diethylphosphonoacetate, delivering allyl ester **334b** with 18:1 selectivity for the *E*-isomer. Subsequent deprotection, bis-silylation and Pd-catalyzed removal of the allyl ester improved the overall yield of **337** dramatically (75% from aldehyde **332**). Transformation into acylazide **338** ((PhO)₂P(O)N₃, NEt₃, PhMe) preceded a Curtius rearrangement induced by heat (PhH, 80°C, 6 h). Although the corresponding vinylic isocyanate **339** was stable to chromatographic purification, it was usually engaged in the next reaction without purification. See Fig. 15.

[00172] Fig. 15 shows that final carbon-carbon bond formation proceeded smoothly via the addition of hexadienyllithium, prepared in situ from bromide **340** via metal-halogen exchange (*t*-BuLi, Et₂O), to a -78°C solution of isocyanate **339**. Compound **341** was obtained as an inseparable mixture of 22-*Z* and 22-*E* isomers together with a chromatographically (silicagel) more mobile fraction containing a mixture of *E/Z*-dimeric compounds **342**. Careful fluoride-assisted desilylation was best performed with a buffered solution of commercially available HF-pyridine in THF/pyridine. At this point, geometrical isomers **301a/301c** and **343/344** could be separated by semi-preparative HPLC.

[00173] In contrast to the current study, we had initially synthesized *ent*-**301a** based on the absolute configuration reported for the natural product. Although this synthetic material was found to be identical to natural salicylihalamide A according to NMR ([D₆]benzene and [D₄]methanol), IR, UV, and co-elution on HPLC (2 different solvent systems), and TLC (3 different solvent systems), the signs of the optical rotations of synthetic *ent*-**301a** ($[\alpha]^{23}_D = +20.8$; $c = 0.12$; MeOH) and the natural product (reported: $[\alpha]^{23}_D = -35$; $c = 0.7$; MeOH), were opposite. Moreover, synthetic *ent*-**301a** was devoid of growth inhibitory activity when screened against the NCI 60-cell line panel. At this point we had the fortune that *p*-bromobenzoate derivative **348** provided crystals suitable for X-ray diffraction studies, confirming the absolute

configuration of our synthetic lactones (Fig. 11(a) & (b)). Based on all the available evidence, the absolute configuration of natural (–)-salicylihalamide A was assigned to be as drawn in **301a**. Unequivocal proof for the absolute stereochemistry of natural salicylihalamide ultimately came from biological characterization of synthetic **301a**, which provided a differential cytotoxicity profile undistinguishable from the natural product in the NCI-60 cell line panel. It is noted that careful examination of the ¹H-NMR spectra of natural salicylihalamide A indicates the presence of a minor contaminant with an identical spectroscopic signature to our synthetic Z,E-isomer **1c** (see FIG. 25 and FIG. 27). This contaminant could be a natural isomer of salicylihalamide A, or the result of isomerization during the isolation/purification procedure.

[00174] Structural variants with a suitable reporter were then orchestrated towards side-chain modifications, emanating from a common, naturally configured isocyanate **339**, now accessible in 20 steps (longest linear sequence) and 21-25% overall yield. Thus, compound **346** and the corresponding dimer **345** were prepared by addition of hexyllithium (instead of hexadienyllithium) to isocyanate **339** followed by final deprotection (Fig. 15). An inverse addition of isocyanate **339** to a cold solution (-78°C) of organolithium nucleophiles was next explored in order to suppress dimer formation. Indeed, preparation of alkynoyl enamine derivatives **349/350** followed this procedure, and no trace of dimer formation was detected (Fig. 15). Alternatively, carbamates or thiocarbamates **351-354** are obtained in an operationally simplified procedure by heating the acylazide **338** in the presence of the appropriate alcohol or thiol (Fig. 15).

[00175] A cell-based assay looking for growth inhibition of the SK-MEL 5 human melanoma cell line was performed. Side chain modified analogs **343-346** and **349-352** all retain

cytostatic and cytotoxic properties at similar concentrations than the parent compound. See Table 3 below.

Table 3

[00176] ^a Growth inhibition was determined 2 days after the addition of the compounds by the MTT assay (Mosmann, T. *J. Immunol. Methods* **1983**, *65*, 55-63). The GI₅₀ values (drug concentrations required to inhibit growth by 50%) were calculated based on triplicate assays at 4 different concentrations of the drug.

[00177] In addition, the ability of compounds 323a/c and 343 to inhibit growth of a number of tumor cell lines was tested and compared to TAXOL's ability to inhibit growth of these tumor cell lines. The data are indicated below in Table 4.

Table 4

[00178] This indicates that the dienamide is not acting as a Michael acceptor for biological relevant nucleophiles (346, 351-352) and that substantial sterically demanding modifications can be accommodated without abrogating biological activity (343-345). The Vacuolar ATPase was identified as a putative target of salicylihalamide A It has subsequently been confirmed that the potent V-ATPase inhibitory activity of our synthetic salicylihalamides (*see* Table 5 below) and identified the membrane spanning Vo proton channel as the binding site for salicylihalamide A. The data of Table 5 was acquired using a purified system. Others in the

art typically use crude membrane preparations to assay V-ATPase activity. Such a crude assay does not necessarily reflect V-ATPase specific activity.

(a) IC₅₀'s were measured according to: Xie X-S, Tsai SJ, Stone DK (1988) Proton pump in clathrin-coated vesicles. *Methods in Enzymology* 157, 634-646. See also Crider, Xie and Stone, *J. Biol. Chem.* 269:17379-17381 (1994).

[00179] In light of this, we prepared analogs **353/354** incorporating a lipophilic cholesteryl or farnesyl anchor hoping to target these derivatives to the membrane (Fig. 15).

[00180] Side chain modified analogs that lack salicylihalamide's characteristic N-acyl enamine functionality are attractive candidates for the following reasons: (1) they are expected to confer increased acid stability; (2) they can potentially be prepared via shorter

sequences; and (3) they would answer an important question related to the functional role of the *N*-acyl enamine moiety. Octanoate **355**, a compound with identical chain length and similar hydrophobicity than salicylihalamide, is representative of this class of compounds and was prepared from alcohol **331** via a Mitsunobu esterification followed by deprotection (Fig. 17). However, both octanoate **355** and allyl ester **335b** (Fig. 13) were completely inactive in the cell-based assay and 2-3 orders of magnitude less potent than salicylihalamide in the *in vitro* V-ATPase assay.

[00181] At this point, we became entertained with the possibility that salicylihalamides could form a covalent complex with a putative binding protein through capture of an activated *N*-acyliminium ion by a nucleophilic amino acid residue (Fig. 17), which could explain the loss of biological activity for derivatives **355/335b**.

[00182] A minimally perturbed probe to test this hypothesis was envisioned to arise from a simple saturation of the enamine double bond of biologically active salicylihalamide derivative **351**. However, direct hydrogenation of **351** also saturated the endocyclic double bond to produce **362** (Fig. 18). Because there was no obvious short solution to this chemoselectivity problem, a control reagent **361** was prepared as a probe to investigate independently the effect of endocyclic double bond saturation on biological activity (Fig. 18). Our point of departure entailed a hydrogenation of **329a** or **330a** with concomitant removal of the *p*-methoxybenzyl (PMB) ether. Subsequent conversion of **356** to **361** took full advantage of the chemistry outlined for the preparation of **351** without complication. Hydrogenation of this material also yielded the fully saturated salicylihalamide derivative **362**. *In vivo*, N- carbamoyl enamine derivative **361** retained a significant, although attenuated, level of growth inhibitory activity whereas the enamine to amine permutation (**361**→**362**) completely abolished antiproliferative potential. In

the *in vitro* V-ATPase assay, inhibition of proton pumping also decreases in the order **351** (IC_{50} 0.2 nM) > **361** (IC_{50} 9.3 nM) > **362** (IC_{50} 75.7 nM). See Table 3 above. Because it was demonstrated that salicylihalamide is a reversible inhibitor of V-ATPase, it is likely that other factors, perhaps increased conformational flexibility, are responsible for the decreased biological activity of **362** (and to a lesser extend for **361**).

[00183] It became apparent from these studies that a photo-activatable salicylihalamide reagent had to be developed in order to map the salicylihalamide binding site on V-ATPase in molecular detail. Although the potent *in vivo* and *in vitro* biological activity of salicylihalamide-based dimers **343-345** points to a potential site for attachment, the phenolic and secondary hydroxyls were also investigated as a handle for derivatization (Scheme 10). Starting with bis-TBS derivative **336**, selective deprotection of the phenolic (TBAF, THF, 0°C, 91%) or secondary TBS ether (aq. HCl, 91%) was followed by benzoylation to furnish benzoates **363** (%) and **364** (50%) respectively. Together with compound **334d**, these materials were independently elaborated to bis- and mono-protected forms of salicylihalamide derivative **351**, namely compounds **365-367**. See Fig. 19. For the V-ATPase activity of **365-367** see Table 5 above

Example 8: Experimental Procedures for the Synthesis of Synthetic Salicylihalalmides and Characterization Data:

I. General Techniques

[00184] Unless noted otherwise, commercially available materials were used without further purification. All solvents used were of HPLC- or ACS-grade. Solvents used for moisture sensitive operations were distilled from drying agents under a nitrogen atmosphere: Et₂O and THF from sodium benzophenone ketyl; benzene and toluene from sodium; CH₂Cl₂, CH₃CN, NEt₃ and pyridine from CaH₂.

[00185] All moisture sensitive reactions were carried out under a nitrogen atmosphere with magnetic stirring. Flash chromatography (FC) was performed using *E Merck* silicagel 60 (240-400 mesh) according to the protocol of Still, Kahn, and Mitra (*J. Org. Chem.* 1978, 43, 2923). Thin Layer chromatography was performed using precoated plates purchased from *E. Merck* (silicagel 60 PF254, 0.25 mm) that were visualized using a KMnO₄ or Ce(IV) stain.

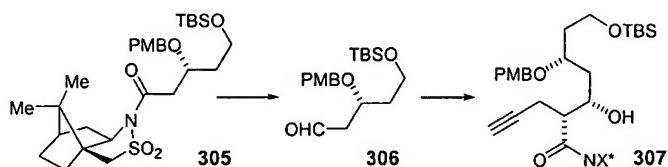

[00186] Nuclear magnetic resonance (NMR) spectra were recorded in CDCl₃, unless otherwise specified, on either a *Varian Inova-400* or *Mercury-300* spectrometer at operating frequencies of 400 / 300 MHz (¹H NMR) or 100 / 60 MHz (¹³C NMR). Chemical shifts (δ) are given in ppm relative to residual solvent (usually chloroform; δ 7.27 for ¹H NMR or δ 77.25 for proton decoupled ¹³C NMR), and coupling constants (J) in Hz. Multiplicity is tabulated as s for singlet, d for doublet, t for triplet, q for quadruplet, and m for multiplet, whereby the prefix *app* is applied in cases where the true multiplicity is unresolved, and *br* when the signal in question is broadened.

[00187] Infrared spectra were recorded on a *Perkin-Elmer 1000* series FTIR with wavenumbers expressed in cm⁻¹ using samples prepared as thin films between salt plates. High-resolution mass spectra (HRMS) were recorded at the NIH regional mass spectrometry facility at the University of Washington, St. Louis, MO. Combustion analyses were performed by. Optical rotations were measured at 20°C on a *Perkin-Elmer 241 MC* polarimeter.

II. Experimental Procedure

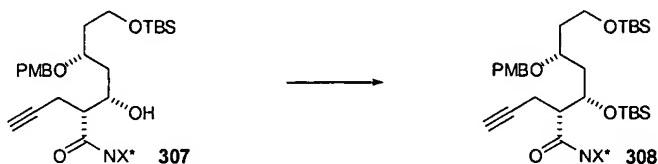

[00188] To a stirred solution of alcohol **304** (3.71 g, 8.57 mmol) in Et₂O (60 mL) was added *p*-methoxybenzyltrichloroacetimidate (4.3 g, 17.14 mmol) followed by trifluoromethanesulfonic acid (2.3 μ L, 0.026 mmol) and the mixture was stirred for 2 h at rt. The mixture was quenched with aqueous sat. NaHCO₃ and extracted with Et₂O (3 \times). The combined organic layers were washed (brine), dried (Na₂SO₄) and concentrated. Purification by FC yielded 3.4 g (72%) of *p*-methoxybenzyl ether **305** as a colorless oil. **305**: $[\alpha]_D = -32.8$ (CHCl₃, *c* 1.18); IR 2956, 2857, 1697, 1613, 1514, 1331, 1250, 1136, 1096, 836, 777 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.26 (2H, d, *J* = 8.4 Hz), 6.85 (2H, d, *J* = 8.4 Hz), 4.55 (1H, d, *J* = 10.8 Hz), 4.43 (1H, d, *J* = 10.8 Hz), 4.17-4.11 (1H, m), 3.88 (1H, app.t, *J* = 6.4 Hz), 3.79 (3H, s), 3.70 (2H, app.t, *J* = 6.4 Hz), 3.50 (1H, d, *J* = 13.6 Hz), 3.43 (1H, d, *J* = 13.6 Hz), 3.02 (1H, dd, *J* = 6.4, 16.0 Hz), 2.98 (1H, dd, *J* = 6.4, 16.0 Hz), 2.05-2.12 (2H, m), 1.75-1.96 (5H, m), 1.32-1.43 (2H, m), 1.14 (3H, s), 0.96 (3H, s), 0.89 (9H, s), 0.04 (6H, s); ¹³C NMR (75 MHz, CDCl₃) δ 169.9, 159.2, 130.9, 129.5, 113.8, 72.9, 71.4, 65.3, 59.6, 55.4, 53.1, 48.5, 47.9, 44.8, 41.2, 38.7, 38.0, 33.0, 26.6, 21.0, 20.0, 18.4, -5.1, -5.2; MS (CI) 550 ([M-OMe]⁺, 2), 121 (100). HRMS Calcd for C₂₉H₄₈NO₆SSi (MH⁺): 566.2972. Found: 566.2956.

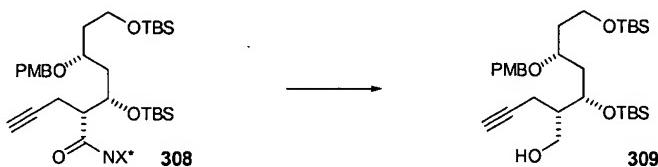

[00189] To a -78°C solution of *p*-methoxybenzyl ether **305** (2.4 g, 4.34 mmol) in CH₂Cl₂ (40 mL) was added dropwise DIBAL-H (1.0 M in CH₂Cl₂, 5.2 mL). After stirring for 1 h at -78°C, MeOH (2 mL) was added and stirring was continued for 5 min after which the cooling bath was removed and solid NaSO₄·10H₂O was added portionwise. After stirring for 1 h at rt, the solid was removed by filtration and washed several times with EtOAc. The filtrate was

concentrated and the residue partially purified to remove most of the bornanesultam auxiliary. The crude aldehyde **306** (~1 g) was used in the next step without further purification.

[00190] To a stirred solution of (2R)-N-(4'-pentynoyl)bornanesultam (950 mg, 3.22 mmol) in CH₂Cl₂ (20 mL) at -78°C was added TiCl₄ (343 µL, 3.13 mL) and *i*-Pr₂NEt (0.56 mL, 3.22 mmol). After stirring for 1 h at the same temperature, a solution of aldehyde **306** (~1 g) in CH₂Cl₂ (2 mL) was added. After stirring for 2 h at -78°C, aqueous sat. NH₄Cl was added and an extraction was performed with EtOAc (3×). The combined organic layers were washed (brine), dried (Na₂SO₄) and concentrated. The residue was purified by FC (15% EtOAc / hexanes) yielding 1.33 g (74%) of aldol product **307** as a white foam. **307**: [α]_D = -54.7 (CHCl₃, *c* 1.39); IR 3480, 2956, 2857, 1694, 1613, 1514, 1334, 1250, 1095, 836, 777 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.25 (2H, d, *J* = 8.4 Hz), 6.84 (2H, d, *J* = 8.4 Hz), 4.49 (1H, d, *J* = 10.8 Hz), 4.45 (1H, d, *J* = 10.8 Hz), 4.26-4.32 (1H, m), 3.70-3.93 (2H, m), 3.78 (3H, s), 3.62-3.73 (2H, m), 3.52 (1H, d, *J* = 2.4 Hz), 3.50 (1H, d, *J* = 13.6 Hz), 3.42 (1H, d, *J* = 13.6 Hz), 3.24 (1H, ddd, *J* = 4.8, 7.2, 7.2 Hz), 2.84 (1H, ddd, *J* = 2.8, 7.2, 17.2 Hz), 2.70 (1H, ddd, *J* = 2.4, 4.8, 17.2 Hz), 2.10-2.17 (1H, m), 2.04 (1H, dd, *J* = 7.6, 14.0 Hz), 1.96 (1H, app.t, *J* = 2.4 Hz), 1.84-1.94 (5H, m), 1.69-1.78 (1H, m), 1.63 (1H, ddd, *J* = 2.0, 6.4, 14.4 Hz), 1.30-1.42 (2H, m), 1.19 (3H, s), 0.95 (3H, s), 0.88 (9H, s), 0.03 (6H, s); ¹³C NMR (75 MHz, CDCl₃) δ 172.7, 159.3, 130.6, 129.6, 113.9, 80.5, 74.3, 71.2, 71.0, 67.2, 65.2, 59.6, 55.3, 53.3, 49.5, 48.4, 47.9, 44.7, 38.5, 37.5, 36.8, 32.9, 26.6, 26.1, 20.9, 20.0, 18.4, 18.3, -5.2; MS (CI) 648 [MH]⁺, 632, 590, 121 (100). HRMS Calcd for C₃₄H₅₄NO₇SSi (MH⁺): 648.3390. Found: 648.3368.

[00191] To a solution of **307** (1.27 g, 1.96 mmol) in CH₂Cl₂ (10 mL) was added at -10°C 2,6-lutidine (0.342 mL, 2.94 mmol), followed by TBSOTf (0.496 mL, 2.16 mmol). The solution was stirred for 2 h at -10°C and 2 h at rt followed by quenching with aqueous sat NH₄Cl. The aqueous layer was extracted with EtOAc (3×) and the combined organics were washed (brine), dried (Na₂SO₄) and concentrated. The residue was purified by FC (10% EtOAc / hexanes) to give 1.33 g of silylether **308** as a colorless oil (90%). **308**: [α]_D = -36.5 (CHCl₃, c 0.54); IR 2956, 2857, 1700, 1613, 1515, 1332, 1250, 1100, 837, 777 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.33 (2H, d, *J* = 8.8 Hz), 6.85 (2H, d, *J* = 8.8 Hz), 4.47 (2H, s), 4.37 (1H, dd, *J* = 5.6, 11.6 Hz), 3.88 (1H, dd, *J* = 5.2, 7.6 Hz), 3.79 (3H, s), 3.65-3.75 (3H, m), 3.49 (1H, d, *J* = 13.6 Hz), 3.41 (1H, d, *J* = 13.6 Hz), 3.37-3.42 (1H, m), 2.80 (1H, ddd, *J* = 2.4, 8.4, 16.8 Hz), 2.61 (1H, ddd, *J* = 2.4, 3.6, 16.8 Hz), 2.15-2.22 (1H, m), 2.07 (1H, dd, *J* = 8.0, 14.0 Hz), 1.93 (1H, t, *J* = 2.4 Hz), 1.77-1.92 (6H, m), 1.67 (1H, ddd, *J* = 4.4, 6.4, 14.8 Hz), 1.30-1.44 (2H, m), 1.20 (3H, s), 0.96 (3H, s), 0.91 (9H, s), 0.89 (9H, s), 0.07 (3H, s), 0.06 (9H, s); ¹³C NMR (75 MHz, CDCl₃) δ 171.2, 159.0, 131.4, 129.4, 113.7, 81.6, 72.8, 70.6, 69.6, 68.8, 65.4, 59.9, 55.3, 53.3, 50.2, 48.5, 47.9, 44.6, 42.2, 38.5, 37.7, 32.8, 26.6, 26.20, 26.17, 20.8, 20.1, 18.5, 18.3, 18.0, -4.0, -4.1, -5.1; MS (CI) 762 [MH]⁺, 713, 704, 514, 121 (100). HRMS Calcd for C₄₀H₆₈NO₇SSi₂ (MH⁺): 762.4255. Found: 762.4246.

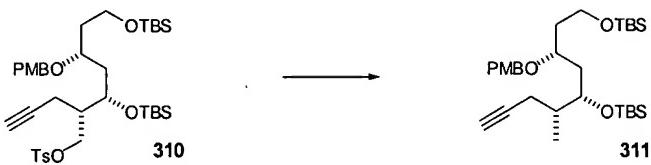

[00192] To a solution of silylether **308** (1.32 g, 1.73 mmol) in THF (60 mL) was added LiEt₃BH (1.0 M solution in THF, 10.4 mL) at -78°C. After stirring for 2h at -78°C and 5 h at -40°C, aqueous NaOH (2.0N, 30 mL) was added and the mixture was allowed to reach rt.

Extraction (EtOAc, 3×), washing (brine), drying (Na_2SO_4) and concentration gave a residue that was purified by FC (10% EtOAc / hexanes). Alcohol **309** was obtained as a colorless oil (0.8 g, 84%). **309**: $[\alpha]_D = -10.4$ (CHCl_3 , *c* 1.01); IR 3500, 2955, 2930, 2858, 1614, 1515, 1251, 1094, 837, 776 cm^{-1} ; ^1H NMR (400 MHz, CDCl_3) δ 7.29 (2H, d, *J* = 8.8 Hz), 6.87 (2 H, d, *J* = 8.8 Hz), 4.54 (1H, d, *J* = 11.2 Hz), 4.41 (1H, d, *J* = 11.2 Hz), 4.16-4.21 (1H, m), 3.81 (3H, s), 3.65-3.80 (5H, m), 2.52 (1H, *app.t*, *J* = 5.6 Hz), 2.13-2.19 (2H, m), 2.02-2.09 (1H, m), 1.99 (1H, *app.t*, *J* = 2.4 Hz), 1.69-1.90 (3H, m), 1.61 (1H, *ddd*, *J* = 3.2, 7.6, 14.0 Hz), 0.91 (9H, s), 0.90 (9H, s), 0.07 (6H, s), 0.066 (6H, s); ^{13}C NMR (75 MHz, CDCl_3) δ 159.3, 131.1, 129.3, 113.9, 83.1, 73.4, 71.3, 70.3, 69.8, 63.6, 59.7, 55.5, 45.3, 38.8, 37.7, 26.18, 26.1, 18.5, 18.2, 17.1, -4.1, -5.1; MS (CI) 551 ($[\text{MH}]^+$, 4), 493, 121 (100). HRMS Calcd for $\text{C}_{31}\text{H}_{55}\text{O}_5\text{Si}_2$ (MH^+): 563.3588. Found: 563.3572. **318-E**: $[\alpha]_D = -11.8$ (CHCl_3 , c 0.11); IR ^1H NMR (400 MHz, CDCl_3) 7.25 (1H, dd, J = 8.4, 8.0 Hz), 6.80 (1H, d, J = 8.4 Hz), 6.78 (1H, d, J = 8.0 Hz), 5.42-5.54 (1H, m), 5.40 (1H, ddd, J = 2.8, 8.0, 15.2 Hz), 5.23-5.28 (1H, m), 3.88 (1H, dd, J = 6.0, 6.0 Hz), 3.80 (3H, s), 3.79-3.84 (1H, m), 3.68-3.75 (2H, s), 3.14 (1H, br d, J = 15.2 Hz), 2.39-2.46 (1H, m), 2.20-2.30 (1H, m), 1.95-2.04 (1H, m), 1.76-1.90 (3H, m), 1.52-1.60 (1H, m), 0.93 (3H, d, J = 7.2 Hz), 0.91 (9H, s), 0.88 (9H, s), 0.073 (3H, s), 0.068 (3H, s), 0.04 (3H, s), 0.02 (3H, s); ^{13}C NMR (75 MHz, CDCl_3) δ 168.7, 156.8, 140.2, 130.5, 128.5, 124.5, 122.7, 109.4, 77.4, 71.8, 60.3, 55.8, 38.5, 37.2, 36.3, 29.9, 26.2, 26.1, 18.5, 18.3, -3.8, -4.0, -5.0.

[00200] *B*-methoxy diisopinocampheylborane (13.7 g; 43.25 mmol) was dissolved in Et_2O (80 mL), cooled to -78°C, followed by the dropwise addition of allylmagnesium bromide (1.0M in Et_2O , 41.7 mL). After stirring for 20 min at -78°C and

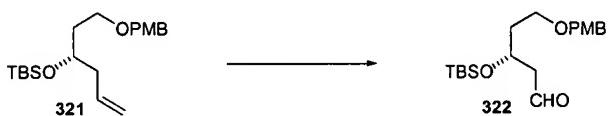

warming to rt over a 1.5 h period, a precipitate formed (magnesium salts) and an additional 150 mL of Et₂O was added. The precipitate was filtered under inert atmosphere and washed with Et₂O (50 mL). The filtrate was cooled to -78°C and a solution of aldehyde **319** (6.0 g, 30.89 mmol) in Et₂O (40 mL) was added dropwise. After stirring for 4 h at the same temperature, the mixture was treated with aqueous NaOH (2.0 N, 25 mL) and allowed to come to rt. Aqueous H₂O₂ (30%, 28 mL) was slowly added and stirring was continued overnight. The aqueous layer was extracted with Et₂O (3×) and the combined organics dried over MgSO₄ and concentrated *in vacuo*. FC (5% → 10% → 20% EtOAc / hexanes) afforded 6.0 g (25.4 mmol, 82%) of allyl alcohol **320**. **320**: [α]_D = -3.9 (*c* 1.02, CHCl₃); IR 3445, 2936, 2863, 1613, 1514, 1248, 1090, 1034 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.25 (2H, d, *J* = 8.8 Hz), 6.87 (2H, d, *J* = 8.8 Hz), 5.83 (1H, dddd, *J* = 7.2, 7.2, 10.2, 17.0 Hz), 5.10 (1H, *br* d, *J* = 17.0), 5.09 (1H, *br* d, *J* = 10.2 Hz), 4.45 (2H, s), 3.82-3.89 (1H, m), 3.80 (3H, s), 3.68 (1H, *app*.dt, *J* = 5.6, 9.6 Hz), 3.61 (1H, ddd, *J* = 5.6, 7.2, 9.6 Hz), 2.90 (1H, *br* s), 2.40 (2H, *br* *app*.t, *J* = 7.0 Hz), 1.72-1.77 (2H, m); ¹³C NMR (75 MHz, CDCl₃) δ 159.3, 135.0, 130.1, 129.4, 117.6, 114.0, 73.2, 70.7, 68.9, 55.5, 42.2, 36.1; HRMS Calcd for C₁₄H₂₁O₃ (MH⁺): 237.1491. Found: 237.1495.

[00201] To a solution of allyl alcohol **320** (12 g, 50.78 mmol), imidazole (10.48 g, 152.34 mmol) and DMAP (200 mg) in DMF (200 mL) was added *tert*.butyldimethylsilyl chloride (23.4 g, 152.34 mmol). After stirring for 16 h at rt, the mixture was poured into water, extracted with Et₂O (3×), and the combined organics washed with brine, dried over MgSO₄ and concentrated *in vacuo*. FC (2% EtOAc / hexanes) yields 16.7 g of silylether **321** (94%) as an oil.

321: [α]_D = 14.8 (*c* 1.51, CHCl₃); IR 2929, 2856, 1612, 1514, 1248, 1093, 1040, 835, 774 cm⁻¹;

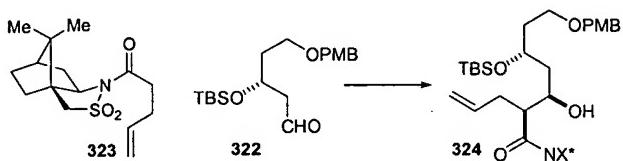

¹H NMR (400 MHz, CDCl₃) δ 7.25 (2H, d, *J* = 8.8 Hz), 6.87 (2H, d, *J* = 8.8 Hz), 5.75-5.86 (1H, m), 5.00-5.05 (2H, m), 4.44 (1H, d, *J* = 11.6 Hz), 4.38 (1H, d, *J* = 11.6 Hz), 3.86-3.91 (1H, m), 3.80 (3H, s), 3.50 (2H, *app.t*, *J* = 6.4 Hz), 2.16-2.28 (2H, m), 1.64-1.81 (2H, m), 0.88 (9H, s), 0.05 (3H, s), 0.04 (3H, s); ¹³C NMR (75 MHz, CDCl₃) δ 159.2, 135.1, 130.8, 129.4, 117.1, 113.9, 72.8, 69.2, 67.0, 55.5, 42.6, 37.0, 26.2, 18.4, -4.0, -4.3; MS (CI) 309 ([M-C₃H₅]⁺, 8), 121 (100). Anal. Calcd for C₂₀H₃₄O₃Si: C, 68.52; H, 9.78. Found: C, 68.77; H, 9.78.

[00202] To a stirred solution of silylether **321** (22.2 g, 57.0 mmol) in acetone (220 mL) at 0°C was added N-methyl-morpholine-N-oxide (50% wt in water, 16.0 g, 68 mmol) followed by OsO₄ (0.1 M in *t*-BuOH, 5.7 mL). The yellow solution was stirred for 4 h at 0°C and 12 h at rt followed by concentration *in vacuo*. The residue was partitioned between EtOAc (200 mL) and brine (350 mL) to which aqueous HCl (1.0 N, 55 mL) and Na₂S₂O₃ (10.0 g) were added. Extraction of the aqueous layer with EtOAc (3×), drying of the combined organics over MgSO₄ and concentration *in vacuo*, afforded an oil which was purified by FC (30% → 50% EtOAc / hexanes) afforded 21 g of a mixture of diol diastereomers which was used in the next step without further purification.

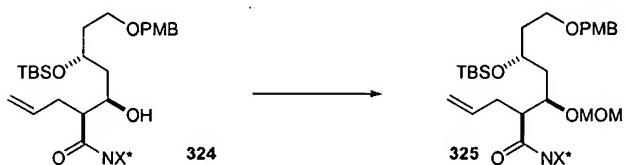

[00203] To a solution of the diol mixture (21 g, 54.6 mmol) in CH₂Cl₂ (300 mL) was added at 0°C silicagel-supported NaIO₄ (11.3 g, 0.582 mmol/g silicagel). After stirring for 2 h at rt, the mixture was filtered, concentrated and purified by FC (10% EtOAc / hexanes) to give 18.0 g of aldehyde **322** (53.04 mmol, 97%). **322**: [α]_D = 5.6 (*c* 2.38, CHCl₃); IR 2955, 2930, 2857, 1726, 1613, 1514, 1250, 1096, 1037, 837, 777 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 9.79 (1H, *app.t*, *J* = 2.4 Hz), 7.25 (2H, d, *J* = 9.2 Hz), 6.88 (2H, d, *J* = 9.2 Hz), 4.43 (1H, d, *J* = 11.2

Hz), 4.38 (1H, d, J = 11.2 Hz), 4.37 (1H, app.dt, J = 6.0, 6.0 Hz), 3.81 (3H, s), 3.51 (2H, app.t, J = 6.0 Hz), 2.58 (1H, ddd, J = 2.0, 5.6, 16.0 Hz), 2.51 (1H, ddd, J = 2.8, 5.6, 16.0 Hz), 1.77-1.90 (2H, m), 0.86 (9H, s), 0.07 (3H, s), 0.06 (3H, s); ^{13}C NMR (75 MHz, CDCl_3) δ 202.1, 159.2, 130.4, 129.4, 113.9, 72.9, 66.2, 65.9, 55.5, 51.3, 37.9, 26.0, 18.3, -4.27, -4.32; HRMS Calcd for $\text{C}_{19}\text{H}_{33}\text{O}_4\text{Si} (\text{MH}^+)$: 353.2148. Found: 353.2165.

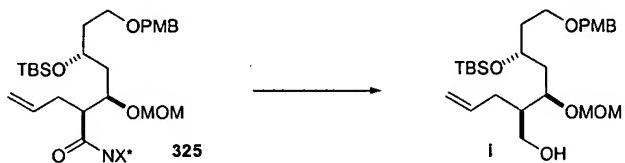

[00204] To a solution of *N*-(4-pentenyl)-bornanesultam **323** (18.3 g, 61.27 mmol) in CH_2Cl_2 (240 mL) was added at -78°C TiCl_4 (6.44 mL, 58.71 mmol), followed by the dropwise addition of $^{\prime}\text{Pr}_2\text{NEt}$ (11.2 mL, 63.82 mmol). The deep red solution was stirred for 1 h at -78°C and a solution of aldehyde **322** (18.0 g, 51.06 mmol) in CH_2Cl_2 (60 mL) was added dropwise. Stirring was continued for 2 h at the same temperature and the mixture was quenched by the addition of phosphate buffer (pH 7.0, 150 mL), saturated aqueous NaHCO_3 (150 mL) and H_2O . The aqueous layer was extracted with CH_2Cl_2 (3×) and the combined organics were dried over MgSO_4 and concentrated *in vacuo*. The residue was purified by FC (15% EtOAc / hexanes) to give 30.4 g of aldol product **324** (46.8 mmol, 92%). **324**: $[\alpha]_D$ = 45.9 (*c* 2.56, CHCl_3); IR 3515, 2956, 2856, 1689, 1613, 1514, 1335, 1249, 1134, 1095, 1038, 836, 776 cm^{-1} ; ^1H NMR (400 MHz, CDCl_3) δ 7.25 (2H, d, J = 8.8 Hz), 6.87 (2H, d, J = 8.8 Hz), 5.79-5.90 (1H, m), 5.08 (1H, br d, J = 17.2 Hz), 4.97 (1H, br d, J = 10.0 Hz), 4.42 (1H, d, J = 12 Hz), 4.38 (1H, d, J = 12.0 Hz), 4.02-4.11 (2H, m), 3.85 (1H, app.t, J = 6.4 Hz), 3.80 (3H, s), 3.51 (2H, app.t, J = 6.4 Hz), 3.49 (1H, d, J = 13.6 Hz), 3.40 (1H, d, J = 13.6 Hz), 3.27 (1H, d, J = 1.6 Hz), 3.21 (1H, app.dt, J = 6.0, 8.0 Hz), 2.50-2.60 (2H, m), 1.99-2.05 (2H, m), 1.72-1.94 (6H, m), 1.59 (1H, ddd, J = 2.0,

[00210] To a stirred suspension of 2,2-dimethyl-5-(trifluoromethanesulfonyl)-benzo[1,3]dioxin-4-one (**iii**) (2.0 g, 6.13 mmol), anhydrous LiCl (0.8 g, 18.4 mmol), $\text{Pd}_2(\text{dba})_3$ (112 mg, 0.12 mmol), and tri-(2-furyl)phosphine (115 mg, 0.49 mmol) in 4-methyl-2-pyrrolidinone (10 mL) was added allyltributyltin (2.35 mL, 7.36 mmol). After stirring for 48 h at rt, saturated aqueous KF (20 mL) was added and an extraction was performed with Et_2O (3×). The combined organics were dried over MgSO_4 , concentrated *in vacuo* and the residue was purified by FC (4% EtOAc / hexanes) to give 1.3 g of 5-allyl-2,2-dimethyl-benzo[1,3]dioxin-4-one (**iv**) which was slightly impure.

[00211] To a stirred solution of allyl alcohol (2.25 mL, 32.8 mL) in THF (10 mL) was added dropwise EtMgBr (1.0M in THF, 29.8 mmol) at 0°C. After stirring for 15 min at rt, a solution of 5-allyl-2,2-dimethyl-benzo[1,3]dioxin-4-one (**iv**) (1.3 g, 5.96 mmol) in THF (5 mL) was added and stirring was continued for 5 h at rt and 2.5 h at 60°C. Diethyl ether (50 mL) was

added and the mixture was poured into saturated aqueous NH₄Cl (20 mL) and water (50 mL). An extraction was performed with Et₂O (3×) and the combined organics were dried over MgSO₄ and concentrated in *vacuo*. The residue was purified by FC (2% Et₂O / pentane) to give 1.2 g of allyl 6-allyl-2-hydroxybenzoate (**v**) (90%) as a colorless oil. **v**: IR 2918, 2850, 1663, 1607, 1450, 1248, 1219, 909, 733 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.33 (1H, *app.t*, *J* = 7.3 Hz), 6.88 (1H, *br d*, *J* = 7.3 Hz), 6.75 (1H, *d*, *J* = 7.3 Hz), 5.92-6.09 (2H, *m*), 5.43 (1H, *br d*, *J* = 14.0 Hz), 5.33 (1H, *br d*, *J* = 8.3 Hz), 5.02 (1H, *br d*, *J* = 10.0 Hz), 4.96 (1H, *br d*, *J* = 16.5 Hz), 4.86 (2H, *br d*, *J* = 6.7 Hz), 3.70 (2H, *d*, *J* = 5.9 Hz); ¹³C NMR (75 MHz, CDCl₃) δ 171.0, 162.8, 143.0, 137.7, 134.6, 131.5, 122.6, 119.8, 116.3, 115.6, 112.2, 66.7, 40.6; MS (EI) 218 (M⁺, 10), 177 (24), 159 (100).

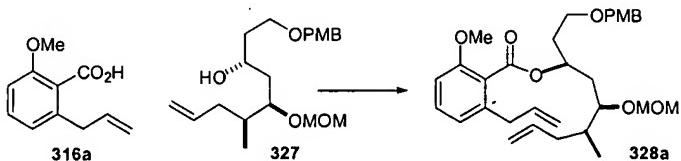

[00212] To a solution of allyl 6-allyl-2-hydroxybenzoate (**v**) (1.2 g, 5.5 mmol) in acetone (12 mL) was added K₂CO₃ (0.84 g, 6.05 mmol) and MeI (1.04 mL, 16.5 mmol) and the mixture was stirred for 40 h at rt. After filtration of the mixture through a short plug of silicagel, the filtrate was concentrated *in vacuo* and the residue purified by FC (3% Et₂O / pentane) to give 1.25 g of allyl 6-allyl-2-methoxybenzoate (**via**) (98%) as a colorless oil. **via**: IR 2918, 2850, 1733, 1715, 1585, 1363, 1244, 1223, 914, 733 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.29 (1H, *app:t*, *J* = 8.0 Hz), 6.83 (1H, *d*, *J* = 7.6 Hz), 6.79 (1H, *d*, *J* = 8.4 Hz), 5.97-6.06 (1H, *m*), 5.86-5.96 (1H, *m*), 5.42 (1H, *br d*, *J* = 17.2 Hz), 5.28 (1H, *br d*, *J* = 10.4 Hz), 5.05 (1H, *br d*, *J* = 16.8 Hz), 5.04 (1H, *br d*, *J* = 10.0 Hz), 4.82 (2H, *br d*, *J* = 6.0 Hz), 3.82 (3H, *s*), 3.36 (2H, *d*, *J* = 6.8 Hz); ¹³C NMR (75 MHz, CDCl₃) δ 167.8, 156.6, 138.7, 136.4, 132.1, 130.6, 123.6, 121.8, 118.8, 116.5, 109.2, 66.0, 56.1, 37.9; MS (EI) 232 (M⁺, 18), 191 (28), 175(34), (147 (50), 132 (100), 115 (58). [00228] According to the procedure described for the synthesis of carboxylic acid 337, allyl ester 359 (21 mg, 0.033 mmol) was deprotected to provide 18 mg of carboxylic acid viii (0.030 mmol, 92%). viii: $[\alpha]_D = -24.7$ (*c* 0.85, CHCl₃); IR 2930, 2858, 1728, 1701, 1657, 1464, 1253 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.15 (1H, dd, *J* = 7.6, 8.0 Hz), 7.03 (1H, ddd, *J* = 6.8, 7.6, 16.0 Hz), 6.75 (1H, d, *J* = 7.6 Hz), 6.70 (1H, d, *J* = 8.0 Hz), 5.94 (1H, br.d (lr), *J* = 16.0 Hz), 5.32-5.41 (1H, m), 3.80-3.88 (1H, m), 2.98-3.12 (1H, m), 2.55-2.68 (2H, m), 2.20-2.30 (1H, m), 1.96-2.08 (1H, m), 1.50-1.70 (5H, m), 1.20-1.48 (3H, m), 0.97 (9H, s), 0.89 (9H, s), 0.88 (3H, d, *J* = 6.8 Hz), 0.25 (3H, s), 0.22 (3H, s), 0.11 (3H, s), 0.05 (3H, s); ¹³C NMR (75 MHz, CDCl₃) δ 171.1, 167.2, 153.5, 146.2, 142.4, 130.6, 125.5, 124.1, 122.7, 117.0, 77.4, 71.0, 39.1, 37.7, 33.2, 30.6, 26.1, 25.9, 18.4, 18.3, 16.3, -3.9, -4.11, -4.13, -4.4; MS (EI) *m/z* (%): 533 (M⁺-57, 8), 459 (7), 367 (100), 365 (66), 309 (12), 115 (64), 75 (24), 73 (52), 57 (83). HRMS Calcd for C₃₂H₅₄O₆Si₂Li (MLi⁺): 597.3619. Found: 597.3617.

[00229] To a stirred solution of acid 337 (52 mg, 0.0883 mmol) and (PhO)₂P(O)N₃ (77.3 μL; 0.353 mmol) in benzene (4 mL) was added Et₃N (58 μL) at RT. After stirring for 14 h at RT, the solvent was removed and the residue was purified by FC (silicagel, 2.5% EtOAc in hexanes). The corresponding acyl azide 338 was obtained in 92% yield (50 mg). 338: ¹H NMR (400 MHz, CDCl₃) δ 7.13 (1H, dd, *J* = 7.6, 8.0 Hz), 7.00 (1H, app.dt, *J* = 7.2, 15.6 Hz), 6.75 (1H, d, *J* = 7.6 Hz), 6.72 (1H, d, *J* = 8.0 Hz), 5.92 (1H, d, *J* = 15.6 Hz), 5.29-5.46 (3H, m), 4.26 (1H, dd, *J* = 3.6, 8.4 Hz), 3.65 (1H, dd, *J* = 9.2, 16.4 Hz), 3.33 (1H, br d, *J* = 16.4 Hz), 2.54-2.65 (2H, m), 2.27 (1H, br.d, *J* = 14.0 Hz), 1.75-1.86 (1H, m), 1.65-1.74 (1H, m), 1.67 (1H, dd, *J* =

8.8, 15.2 Hz), 1.37 (1H, dd, J = 8.8, 15.2 Hz), 0.96 (9H, s), 0.92 (9H, s), 0.83 (3H, d, J = 6.4 Hz), 0.22 (3H, s), 0.20 (3H, s), 0.14 (3H, s), 0.12 (3H, s).

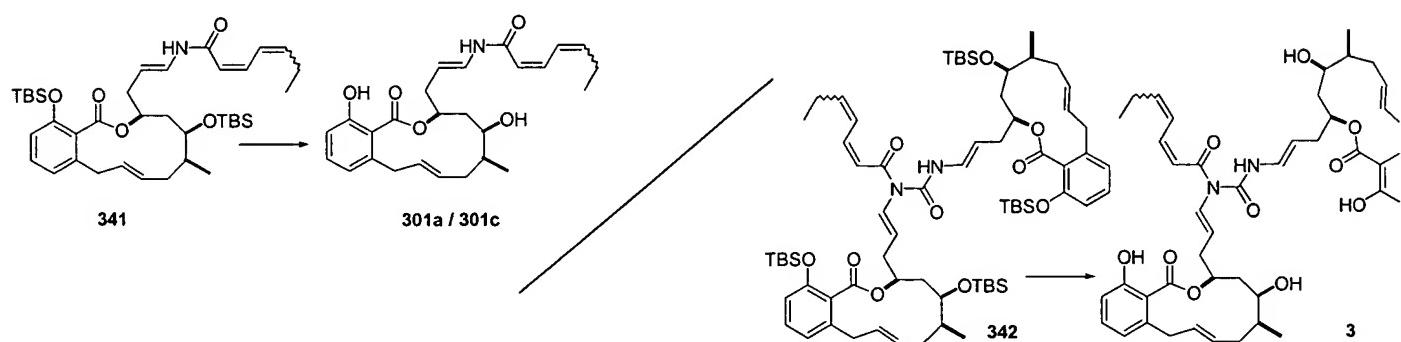

[00230] Acyl azide **ix** was prepared in an identical manner as described for the preparation of acyl azide **338**. **ix**: ^1H NMR (400 MHz, CDCl_3) δ 7.15 (1H, dd, J = 7.6, 8.0 Hz), 7.01 (1H, ddd, J = 7.6, 7.2, 15.6 Hz), 6.76 (1H, d, J = 7.6 Hz), 6.70 (1H, d, J = 8.0 Hz), 5.92 (1H, br.d (lr), J = 15.6 Hz), 5.32-5.40 (1H, m), 3.80-3.88 (1H, m), 2.98-3.10 (1H, m), 2.53-2.68 (2H, m), 2.21-2.30 (1H, m), 1.96-2.06 (1H, m), 1.50-1.68 (5H, m), 1.23-1.45 (3H, m), 0.97 (9H, s), 0.90 (9H, s), 0.87 (3H, d, J = 6.8 Hz), 0.25 (3H, s), 0.22 (3H, s), 0.11 (3H, s), 0.06 (3H, s).

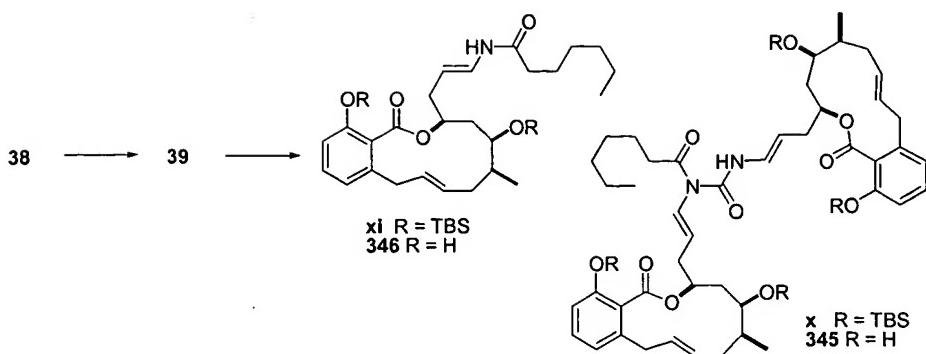

[00231] Acyl azide **338** (12 mg; 0.0195 mmol) in benzene (1 mL) was stirred at 75°C for 6 h, after which the solvent was removed and the residue (isocyanate **339**) dissolved in diethyl ether (1 mL). In a separate flask, a 0.15 M solution of 1-lithio-1,3-hexadiene (1:1 mixture of 1Z,3Z and 1Z,3E isomers) was prepared by the addition of *t*-BuLi (2.05 equiv with respect to the bromide) to a solution of the corresponding bromide in THF at -78°C. After stirring for 45 min at -78°C and warming to RT, the organolithium (0.15 M in THF; 143 μL ; 0.0215 mmol) was

added dropwise to the ethereal solution of isocyanate **339** at -78°C. The mixture was allowed to reach 0°C over a 1 h period followed by the addition of pH 7.0 phosphate buffer. Extraction with diethyl ether (3×), drying (Na_2SO_4), concentration and rapid purification by FC (silicagel, 6% EtOAc in hexanes containing 0.2% Et_3N) gave 3.7 mg of a less polar product **342** and 5.9 mg of a more polar product **341**.

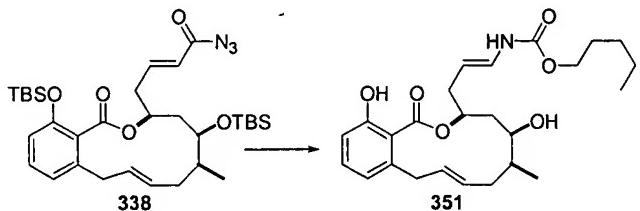

[00232] The less polar product **342** was treated with 250 μL of a solution prepared from 0.5 g commercial HF-pyridine in 1.25 mL pyridine and 6.75 mL THF. The more polar product **341** was similarly treated with 410 μL of the same solution. After stirring for 48 h at RT, the reactions were quenched with a phosphate buffer (pH 7.0; 10 mL), extracted with EtOAc (4×), dried (Na_2SO_4) and concentrated. The product derived from deprotection of **341** was purified by normal-phased semi-preparative HPLC (5 μ Luna silicagel; 250 × 10 mm column; 25% acetone in hexanes, $t_R = 25$ min) yielding 1.7 mg of a 1:1 mixture of salicylihalamide A (**301a**) and the corresponding geometrical isomer **301c** (20% from acyl azide **338**). The product derived from deprotection of **342** provided two fractions after HPLC purification (35% acetone in hexanes): 1.5 mg of **343** ($t_R = 25.7$ min; 10% yield from acyl azide **338**) and 1.5 mg of **344** ($t_R = 26.7$ min; 10% yield from acyl azide **338**). The combined overall yield for **301a,c** and **343-344** from acyl azide **338** is 40%. **343**: ^1H NMR (400 MHz, CD_3OD) δ 7.14 (1H, *app.t*, $J = 8.0$ Hz),

[00243] To a stirred solution of acid **xvi** (15.5 mg, 0.0268 mmol) and $(\text{PhO})_2\text{P}(\text{O})\text{N}_3$ (23 μL , 0.1071 mmol) in benzene (3 mL) was added Et_3N (19 μL , 0.134 mmol) at RT. After stirring for 16 h at RT, the solvent was removed and the residue was purified by FC (17% EtOAc in hexanes). The acyl azide **xvii** was obtained in 78% yield (12.5 mg). **xvii**: ^1H -NMR (400 MHz, CDCl_3) δ 8.18 (2H, dd, $J = 1.2, 7.2$ Hz), 7.67 (1H, m), 7.52 (2H, app.t, $J = 8.0$ Hz), 7.38 (1H, app.t, $J = 8.0$ Hz), 7.14 (1H, d, $J = 7.6$ Hz), 7.12 (1H, d, $J = 7.6$ Hz), 6.72 (1H, ddd, $J = 6.8, 8.0, 14.8$ Hz), 5.46 (1H, br.d, $J = 15.6$ Hz), 5.44 (1H, dddd, $J = 2.4, 2.4, 10.8, 15.2$ Hz), 5.33 (1H, dddd, $J = 2.0, 2.0, 9.2, 15.2$ Hz), 5.19 (1H, ddd, $J = 3.2, 7.6, 7.6$ Hz), 4.23 (1H, dd, $J = 4.0, 9.2$ Hz), 3.81 (1H, dd, $J = 9.2, 16.4$ Hz), 3.41 (1H, br.d, $J = 16.4$ Hz), 2.29 (1H, br.d, $J = 13.6$ Hz), 2.01-2.09 (1H, m), 1.76-1.94 (2H, m), 1.59-1.71 (2H, m), 1.25-1.31 (1H, m), 0.89 (9H, s), 0.80 (3H, d, $J = 6.4$ Hz), 0.19 (3H, s), 0.12 (3H, s).

[00244] A solution of acylazide **xvii** (4 mg, 0.00663 mmol) and 1-pentanol ($4.3\mu\text{L}$, 0.0398 mmol) in benzene (1 mL) was stirred for 6 h at 80°C. After removal of the solvent, the residue was treated with $370\ \mu\text{L}$ of a solution of HF·pyridine in THF. After stirring for 4 days at RT, the reaction was quenched with a phosphate buffer (pH 7.0, 10 mL), extracted with EtOAc ($3 \times 15\ \text{mL}$), dried over MgSO₄ and concentrated. Purification by FC (silicagel, 33% EtOAc in hexanes) gave 1.5 mg of compound **366** (41%). **366**: $[\alpha]_D = -48$ (*c* 0.075, MeOH); IR 3439, 2960, 2929, 1713, 1678, 1452, 1350, 1272, 1230, 974 cm⁻¹; ¹H-NMR (400 MHz, CDCl₃) δ 8.14-8.18 (2H, m), 7.72 (1H, *apt.tt*, *J* = 1.6, 7.6 Hz), 7.58 (2H, *app.t*, *J* = 7.6 Hz), 7.43 (1H, *app.t*, *J* = 8.0 Hz), 7.19 (1H, d, *J* = 8.0 Hz), 7.18 (1H, d, *J* = 8.0 Hz), 6.14 (1H, d, *J* = 14.4 Hz), 5.44-5.51 (1H, m), 5.27-5.34 (1H, m), 5.12-5.18 (1H, m), 4.78 (1H, dd, *J* = 7.6, 14.8), 4.18 (1H, dd, *J* = 3.6, 9.2 Hz), 4.05 (2H, *app.t*, *J* = 6.4 Hz), 3.72 (1H, dd, *J* = 9.2, 16.0 Hz), 3.46 (1H, *br.d*, *J* = 16.0 Hz), 2.26 (1H, br), 1.71-1.90 (4H, m), 1.57-1.66 (3H, m), 1.26-1.38 (5H, m), 0.82 (3H, d, *J* = 6.8 Hz); ¹³C-NMR (75 MHz, CDCl₃) δ 168.5, 166.1, 156.5, 149.5, 141.3, 135.6, 133.5, 131.3 (2C), 130.5, 130.2 (2C), 129.8, 129.4, 129.3, 128.1, 126.6, 122.6, 105.2, 76.5, 72.2, 66.4, 39.0, 38.7, 38.5, 37.2, 36.1, 29.9, 29.3, 23.5, 14.5, 13.6. MS (ES) *m/z* 550.27 ([M+H]⁺, 100). HRMS Calcd for C₃₂H₃₉NO₇Li (MLi⁺): 556.2887. Found: 556.2871.

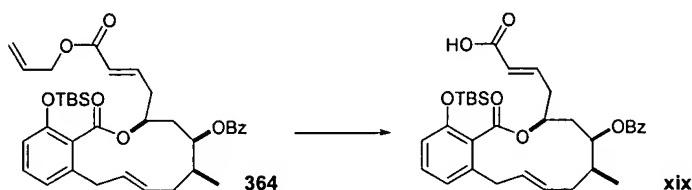

[00245] To a stirred solution of **336** (24 mg, 0.038 mmol) in THF (1.8 mL) was added dropwise concentrated HCl ($55\mu\text{L}$) at RT. After stirring for 2 h at RT, the reaction was quenched by the addition of saturated aq. NaHCO₃ (2 mL) and extracted with EtOAc (20 mL). The organic layer was washed with brine, dried over MgSO₄, filtered and concentrated. Purification by FC (silicagel, 25% EtOAc in hexanes) provided 18 mg of the alcohol **xviii** (91%) as a colorless oil. **xviii**: $[\alpha]_D = +27$ (*c* 0.9, CHCl₃); IR: 2930, 1724, 1581, 1457, 1280, 1167, 1115, 1066, 1028, 839 cm⁻¹; ¹H-NMR (300 MHz, CDCl₃) δ 7.14 (1H, *app.t*, *J* = 8.1 Hz), 6.98 (1H, *ddt*, *J* = 7.5, 7.5, 15.6 Hz), 6.76 (1H, *d*, *J* = 7.5 Hz), 6.74 (1H, *d*, *J* = 8.1 Hz), 5.89-6.30 (2H, m), 5.33-5.52 (3H, m), 5.34 (1H, *app.qd*, *J* = 1.5, 17.4 Hz), 5.26 (1H, *app.qd*, *J* = 1.5, 10.5 Hz), 4.66 (2H, *app.dt*, *J* = 1.5, 6.0 Hz), 4.24 (1H, *br.d*, *J* = 9.6 Hz), 3.66 (1H, *dd*, *J* = 9.3, 16.2 Hz), 3.32 (1H, *br.d*, *J* = 16.5 Hz), 2.55-2.72 (2H, m), 2.22-2.34 (1H, m), 1.80-1.95 (1H, m), 1.66-1.80 (2H, m), 1.44 (1H, *dd*, *J* = 6.0, 15.6 Hz), 0.96 (9H, s), 0.87 (3H, *d*, *J* = 6.6 Hz), 0.21 (3H, s), 0.18 (3H, s); ¹³C-NMR (75 MHz, CDCl₃) δ 168.4, 166.0, 153.0, 143.9, 139.0, 132.4, 131.5, 129.9, 128.8, 127.4, 124.4, 123.4, 118.5, 118.0, 72.4, 71.4, 65.3, 38.5, 38.1, 38.0, 37.5, 35.8, 26.0 (3C), 18.6, 13.9, -3.8, -3.9. HRMS Calcd for C₂₉H₄₂O₆SiLi (MLi⁺): 521.2911. Found: 521.2904.

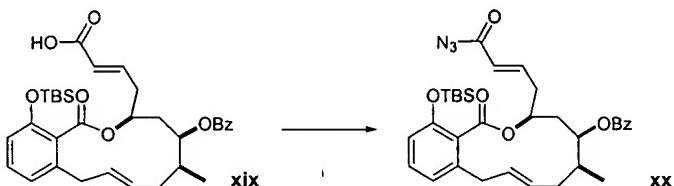

[00246] To a solution of **xviii** (14 mg, 0.027 mmol) in pyridine (0.5 mL) was added benzoyl chloride ($10\mu\text{L}$, 0.085 mmol) at 0°C. The reaction mixture was allowed to warm to RT and stirring was continued overnight. Aq. HCl (2N, 10 mL) was added and an extraction was performed with Et₂O (3 × 10 mL). The combined organic layers were washed with water and brine, dried (MgSO₄), filtered and concentrated. Purification by FC (silicagel, 5% EtOAc in

hexanes) provided 10 mg of the benzoate **364** (50%) as a colorless oil. **364**: $[\alpha]_D = -20.8$ (*c* 0.5, CHCl₃); IR 2930, 1722, 1457, 1270, 1111, 1066, 839, 712; ¹H-NMR (400 MHz, CDCl₃) δ 8.07 (2H, dd, *J* = 2.0, 7.2 Hz), 7.57 (1H, ddd, *J* = 0.8, 7.2, 7.2 Hz), 7.45 (2H, *app.t*, *J* = 8.0 Hz), 7.16 (1H, *app.t*, *J* = 8.0 Hz), 7.00 (1H, ddd, *J* = 7.2, 7.2, 15.6 Hz), 6.78 (1H, d, *J* = 7.6 Hz), 6.75 (1H, d, *J* = 8.0 Hz), 5.90-6.2 (2H, m), 5.64-5.74 (1H, m), 5.57-5.62 (1H, m), 5.36-5.45 (1H, m), 5.35 (1H, *br.d*, *J* = 17.2 Hz), 5.26-5.33 (1H, m), 5.26 (1H, *br.d*, *J* = 11.2 Hz), 4.67 (2H, *br.d*, *J* = 6.0 Hz), 3.79 (1H, dd, *J* = 9.6, 16.0 Hz), 3.34 (1H, *br.d*, *J* = 16.0 Hz), 2.60-2.70 (2H, m), 2.32-2.42 (2H, m), 1.78-1.92 (2H, m), 1.30 (1H, m), 0.94 (9H, s), 0.91 (3H, d, *J* = 6.4 Hz), 0.18 (3H, s), 0.15 (3H, s); ¹³C-NMR (75 MHz, CDCl₃) δ 167.7, 166.1, 165.9, 153.0, 143.8, 139.5, 132.9, 132.4, 130.9, 130.8, 130.0, 129.9 (2C), 129.4, 128.6 (2C), 127.2, 124.4, 123.4, 118.5, 118.0, 76.4, 71.4, 65.3, 38.2, 37.9, 33.3, 33.1, 31.8, 26.0 (3C), 18.6, 14.3, -3.8, -3.9. [00253] A solution of the acyl azide **338** (5 mg, 0.0081 mmol) and 1-pentanethiol (6 μ L, 0.0486 mmol) in benzene (1 mL) was stirred for 5 h at 80°C. After removal of the solvent, the residue was treated with 370 μ L of a solution HF·pyridine in THF (prepared by mixing 2 g commercial HF.Pyr, 10 mL pyridine and 27 mL THF). After stirring for 4 days at RT, the reaction was quenched with a phosphate buffer (pH 7.0; 10 mL), extracted with EtOAc (3 \times 15 mL), dried over MgSO₄ and concentrated. Purification by FC (33% EtOAc in hexanes) gave 3 mg of compound **352** (80%). **352**: $[\alpha]_D = -20.0$ (*c* 0.25, MeOH); IR 3208, 2928, 2855, 1663, 1604, 1451, 1294, 1248, 1184, 948, 825 cm⁻¹; ¹H-NMR (300 MHz, acetone-d₆) δ 9.69 (1H, *br.s*, aryl-OH), 9.08 (1H, *br.d*, *J* = 12.0 Hz, N-H), 7.21 (1H, dd, *J* = 7.5, 7.8 Hz), 6.83 (1H, dd, *J* = 0.9, 7.8 Hz), 6.70-6.78 (1H, m), 6.72 (1H, d, *J* = 7.5 Hz), 5.22-5.40 (4H, m), 3.94 (1H, dd, *J* = 3.9, 9.0 Hz), 3.57 (1H, d, *J* = 5.1 Hz), 3.46-3.52 (2H, m), 2.89 (2H, t, *J* = 7.2 Hz), 2.20-2.32 (1H, m), 1.74-1.94 (3H, m), 1.53-1.64 (2H, m), 1.28-1.38 (5H, m), 0.88 (3H, t, *J* = 6.9 Hz), 0.87 (3H, d, *J* = 6.6 Hz); ¹³C-NMR (75 MHz, CD₃OD) δ 171.2, 157.2, 140.8, 131.8, 130.9, 126.7, 123.2, 122.6, 115.4, 108.6, 76.2, 72.1, 39.1, 38.9, 38.7, 37.4, 36.6, 32.1, 31.4, 30.4, 23.4, 14.5, 13.7; MS (ES) *m/z* 484.33 ([M+Na]⁺, 8), 462.25 ([M+H]⁺, 100). HRMS Calcd for C₂₅H₃₅NO₅SLi (MLi⁺): 468.2396. Found: 468.2400.

[00254] Compound **353** obtained from **338** in 53% yield. **353**: $[\alpha]_D = -15.8$ (*c* 0.019, MeOH); IR 2928, 2853, 1724, 1453, 1376, 1293 cm⁻¹; ¹H-NMR (300MHz, CD₃COCD₃) δ 9.67 (1H, s, aryl-OH), 8.20 (1H, *br.d*, *J* = 10.8 Hz, N-H), 7.22 (1H, *app.t*, *J* = 8.1 Hz), 6.83 (1H,

dd, $J = 0.9, 8.1$ Hz), 6.72 (1H, br.d, $J = 7.6$ Hz), 6.54 (1H, dd, $J = 10.8, 14.4$ Hz), 5.06-5.41 (7H, m), 4.57 (2H, d, $J = 6.9$ Hz), 3.93 (1H, ddd, $J = 3.6, 4.5, 8.1$ Hz), 3.47-3.52 (2H, m), 2.22-2.42 (4H, m), 1.70-1.2.18 (10H, m), 1.71 (3H, s), 1.65 (3H, s), 1.60 (3H, s), 1.59 (3H, s), 1.28-1.42 (1H, m), 0.87 (3H, d, $J = 6.6$ Hz). MS (ES) m/z 580.37 ($[M+H]^+$, 54). HRMS Calcd for $C_{35}H_{49}NO_6Li$ (MLi^+): 586.3720. Found: 856.3690.

[00255] Acyl azide **338** (7 mg, 0.0114 mmol) in benzene (1 mL) was stirred at 80° C for 6 h, after which the solvent was removed and the residue dissolved in THF. In a separate flask, a 0.19 M solution of 1-lithio-phenylacetylene was prepared by deprotonation of phenylacetylene (in THF) with n -BuLi (0.88 equiv.) at -78°C. To this solution (0.2 mL, 0.19 M) in THF was added the isocyanate in THF (0.5 mL) at -78°C. After stirring at -78° C for 50 min, saturated NH₄Cl (3 mL) and water (0.6 mL) were added and the resulting mixture was diluted with Et₂O (45 mL), the layers separated, and the organic layer washed with brine, dried over MgSO₄, filtered and concentrated. Filtration over silicagel (14% EtOAc in hexanes) provided a crude product (6 mg) which was treated with 370 μ L of a solution HF pyridine in THF at RT. After stirring for 48 h at RT, the reaction was quenched with a phosphate buffer (pH 7.0; 10 mL), extracted with EtOAc (3 \times 15 mL), dried over MgSO₄ and concentrated. Purification by FC (silicagel, 33% EtOAc in hexanes) gave 2 mg of compound **349** (56%). **349**: $[\alpha]_D = -42$ (c 0.1, MeOH); IR 2927, 1652, 1605, 1500, 1451, 1294, 1218, 1123; ¹H-NMR (400 MHz, CD₃OD) δ 7.58 (2H, app. dt, $J = 1.6, 6.8$ Hz), 7.40-7.52 (3H, m), 7.14 (1H, app.t, $J = 8.0$ Hz), 6.82 (1H, d, J

= 14.0Hz), 6.74 (1H, d, *J* = 8.4Hz), 6.66 (1H, d, *J* = 7.2Hz), 5.51 (1H, ddd, *J* = 7.6, 7.6, 14.4 Hz), 5.26-5.44 (3H, m), 4.14 (1H, dd, *J* = 3.6, 9.2Hz), 3.58 (1H, dd, *J* = 8.4, 16.4Hz), 3.38 (1H, br), 2.36-2.50 (2H, m), 2.29 (1H, br. d, *J* = 14.4Hz), 1.84-1.94(1H, m), 1.72-1.84 (3H, m), 0.88 (3H, d, *J* = 6.8Hz); MS (ES) *m/z* (%): 460.22 ([M+H]⁺, 100) HRMS (FAB) Calcd for C₂₈H₂₉NO₅Li (MLi⁺): 466.2206. Found: 466:2204.

[00256] Compound **350** is prepared as described for the synthesis of **349** (42% yield). **350**: $[\alpha]_D^{23}$ -24.0 (*c* 0.1, MeOH); IR 2929, 1653, 1498, 1451, 1248, 1111; ¹H-NMR (400 MHz, CD₃OD) δ 7.13 (1H, dd, *J*=7.6, 8.0 Hz), 6.75 (1H, d, *J* = 10.4Hz), 6.73 (1H, d, *J* = 8.0Hz), 6.66 (1H, d, *J* = 7.6Hz), 5.43 (1H, ddd, *J* = 7.2, 7.6, 14.0 Hz), 5.26-5.38 (3H, m), 4.12 (1H, dd, *J* = 3.6, 8.8 Hz), 3.57 (1H, dd, *J* = 8.8, 16.8 Hz), 3.37 (1H, m), 2.24-2.44 (4H, m), 1.70-1.92 (3H, m), 1.32-1.62 (6H, m), 0.94 (3H, t, *J* = 7.6Hz), 0.87 (3H, d, *J* = 6.8Hz); MS (ES) *m/z* (%) : 440.28 ([M+H]⁺, 100), 462.21([M+Na]⁺, 10). HRMS (FAB) Calcd for C₂₆H₃₃NO₅Li (MLi⁺): 446.2519. Found: 446.2513.

[00257] All of the compositions and/or methods disclosed and claimed herein can be made and executed without undue experimentation in light of the present disclosure. While the compositions and methods of the invention have been described in terms of preferred

embodiments, it will be apparent to those of skill in the art that variations may be applied to the compositions and/or methods and in the steps or in the sequence of steps of the method described herein without departing from the concept, spirit and scope of the invention. More specifically, it will be apparent that certain agents which are both chemically and physiologically related may be substituted for the agents described herein while the same or similar results would be achieved. All such similar substitutes and modifications apparent to those skilled in the art are deemed to be within the spirit, scope and concept of the invention as defined by the appended claims.
